Meeting records [📄 Transcript](#)

Summary

Meeting discussions aligned on hackathon planning via technical principles and agreed to categorize agentic workflows into buckets.

Strategic Planning for Agents

Participants established a conceptual framework for agentic workflows by categorizing them into 5 distinct buckets. The group prioritized this

structure to guide future technical implementation and educational materials.

Hackathon and Vendor Strategy

The team decided to adopt a vendor-neutral approach for the upcoming hackathon to ensure broad accessibility. They resolved to use standard data formats like CSV files for training purposes.

Task Allocation and Development

Members distributed responsibilities for defining and documenting the 5 identified buckets. This work will serve as the foundation for both internal and external-facing workshop scenarios.

Rate this Summary: [Helpful](#) or [Not Helpful](#)

Decisions

ALIGNED

- **Workshop goal set for MockX Amsterdam** The group established the strategic goal of developing a hackathon program and associated reference materials for MockX Amsterdam that focuses on teaching the five agent architecture buckets through hands-on experience.
- **Content template format standardized** Content for each agent architecture bucket will follow a standardized template consisting of a definition, an abstract visual diagram, and a tangible use case.
- **CSV chosen as generic data format** Comma-Separated Values (CSV) files are adopted as the standard, vendor-agnostic data format for the demo use cases and open-source project examples.

We've **updated the Decisions section** using your feedback.

Let us know what you think: [Helpful](#) or [Not Helpful](#)

Next steps

- ☐ [Rebecca Veldon, Everett Zufelt] Consult Holly: Gather input from Holly and the wider team regarding the safest methods for referencing specific vendors in marketing content.
- ☐ [The group] Assign Buckets: Select and assign ownership for each of the 5 agent architecture buckets to individual team members to begin development.
- ☐ [The group] Develop Bucket Content: Produce definitions, architecture diagrams, and open source implementation examples for each assigned agent bucket to build a foundational knowledge base.
- ☐ [Everett Zufelt, Rebecca Veldon] Get Program Approval: Obtain formal approval from Holly to proceed with the proposed hackathon program for MockX Amsterdam.
- ☐ [George Fitzgibbons] Send bucket assignments: Post a Slack message outlining the bucket pick order and request team members to sign up for their preferred buckets.
- ☐ [Ryan Lunka] Define use cases: Prepare 2-3 internal and external use cases for bucket 3 using a common customer or order scenario.
- ☐ [Tim Benniks] Define use cases: Prepare 2-3 internal and external use cases for buckets 1 and 2 using a common customer or order scenario.
- ☐ [Daniele Stroppa] Define use cases: Prepare 2-3 internal and external use cases for bucket 4 using a common customer or order scenario.
- ☐ [Danny Lake, Everett Zufelt] Define use cases: Prepare 2-3 internal and external use cases for bucket 5 using a common customer or order scenario.
- ☐ [George Fitzgibbons] Create CSV datasets: Develop a set of generic CSV files containing random customer and order data to support the hackathon use cases.
- ☐ [Everett Zufelt] Draft program agenda: Draft a proposed agenda for the upcoming hackathon event to share with the rest of the team.
- ☐ [Rebecca Veldon] Coordinate with Holly: Coordinate with Holly to discuss the project working groups and resolve outstanding questions.

Details

- **Industry Trends and AI Integration:** Tim Benniks and the group discussed the current AI landscape, specifically noting that relying solely on customer relationship management data or content data is insufficient for creating effective AI experiences. They suggested that this gap may signal a renaissance for headless content management systems, as content is increasingly viewed as a critical component of AI implementations ([00:02:06](#)).
- **Meeting Agenda and Project Introductions:** Everett Zufelt introduced three primary agenda items: obtaining approval to publish an article, introducing an open-source project called "Agency"—a reference architecture for multi-agent systems originating from the Cisco innovation lab and the Linux Foundation—and discussing broader strategic directions for the group ([00:04:09](#)). The team noted that the Agency project had been previously presented at an event in Chicago in April ([00:05:24](#)).
- **Establishing Strategic Goals for Agentic Workflows:** George Fitzgibbons and Tim Benniks proposed organizing the "agent problem" into five conceptual buckets to define their technical approach. They aim to create diagrams and open-source examples for these categories to support hands-on implementation, reaching a consensus to use the term "buckets" rather than "archetypes" to describe these classifications ([00:05:24](#)).
- **Hackathon Planning for MockX Amsterdam:** The team established a goal for the next five to six months: developing a program for a hackathon at MockX Amsterdam. The primary objective is to teach participants about the five buckets, providing enough hands-on experience so attendees can return to their work with tangible results ([00:08:20](#)).
- **Addressing Vendor Neutrality and Technology Choices:** Ryan Lunka raised concerns regarding the selection of specific technologies for the hackathon, fearing it might cause confusion or bias. Tim Benniks and the group discussed the importance of vendor neutrality, with Everett Zufelt acknowledging the political challenge of selecting tools ([00:11:21](#)). They decided to focus on teaching broad possibilities and principles rather than specific deployment targets to remain as neutral as possible ([00:14:41](#)).

- Strategic Content and Vendor Naming Policies:** The group discussed the necessity of mentioning specific vendors to provide meaningful content for learners, despite the political risks associated with potential partner feedback. Everett Zufelt and Tim Benniks agreed to coordinate with Holly to determine safe practices for vendor mentions, noting that they might include disclaimers about the non-exhaustive nature of their lists ([00:18:16](#)). Ryan Lunka suggested they adopt an authoritative, analyst-like position to incentivize partner collaboration ([00:21:43](#)).
- Coordination with Other Working Groups:** Everett Zufelt clarified that a separate working group is focusing on agent adoption and operations, distinguishing their current project from that broader scope ([00:23:31](#)). The team agreed to proceed with their hackathon program development without waiting for the other group's findings ([00:24:40](#)).
- Progressive Learning Model for Workshops:** To make the training relatable, the team discussed using a progressive learning model similar to a Git repository, where complexity increases across the five buckets ([00:25:36](#)). Danny Lake suggested using stubbed tools with common, mock data sets, such as comma separated values (CSV) files, to keep the workshops vendor-agnostic and accessible ([00:26:39](#)).
- Defining Use Cases and Scenarios:** The group discussed utilizing common business scenarios, such as commerce, involving customers, products, and orders, to ensure the content remains relatable across different departments like marketing and supply chain ([00:28:30](#)). They resolved to develop both internal and external-facing use cases for each bucket to ensure the content has broad appeal for potential participants ([00:29:16](#)).
- Iterative Documentation Strategy:** George Fitzgibbons proposed that bucket teams create definitions, diagrams, and use cases as a boilerplate structure ([00:33:38](#)) ([00:46:04](#)). The group agreed that these definitions should remain iterative and that members would have autonomy to refine them as they work within their assigned buckets ([00:48:26](#)).
- Work Distribution and Assignments:** The team began assigning responsibilities for the buckets, with Tim Benniks covering buckets one and two, Ryan Lunka covering bucket three, and Daniele Stroppa covering bucket four. Danny Lake and Everett Zufelt committed to working on bucket five ([00:46:57](#)).
- Technical Implementation and Data Sets:** The group discussed using standardized data formats like CSV files for their examples to ensure

open-source projects remain accessible without requiring specific application programming interface (API) keys ([00:55:09](#)). George Fitzgibbons noted that this approach facilitates a cohesive narrative of growth across the five stages of agentic complexity ([00:55:55](#)).

- **Administrative Next Steps:** Everett Zufelt and Rebecca Veldon agreed to coordinate with Holly to secure formal approval for the proposed hackathon program ([00:22:32](#)) ([00:57:01](#)). The team concluded the meeting with an agreement to develop their specific bucket definitions and use cases prior to the next session ([00:55:09](#)) ([00:57:01](#)).

Agent Ecosystem Working Group 1: Enterprise Agent Architecture - MACH Alliance - Transcript

00:00:00

Rebecca Veldon: Hello.

Tim Benniks: Good morning.

Rebecca Veldon: Good morning. How are you

Tim Benniks: All good.

Everett Zufelt: Good

Rebecca Veldon: doing?

Tim Benniks: It's 5:00 p.m. for me, luckily. Oh, luckily. I'm not sure. Too much to do, though.

Rebecca Veldon: That's fair. It's 400 p.m. for me.

Tim Benniks: Oh, yeah. Exactly. So, just effort and in the morning.

Everett Zufelt: Poor

Rebecca Veldon: Yeah.

Everett Zufelt: me.

Rebecca Veldon: All

Everett Zufelt: Hey, George.

Rebecca Veldon: right.

George Fitzgibbons: There he

Everett Zufelt: There you go. George also is in the

George Fitzgibbons: is.

Tim Benniks: It's also the morning. Yes, now I can say it.

George Fitzgibbons: How?

Danny Lake: Good morning team.

Rebecca Veldon: Hello. All right, I think if we just give it a couple more minutes, let people trickle in and then we can begin. How's everyone's week going so far?

Danny Lake: Too fast.

Rebecca Veldon: Oh, I feel that.

Tim Benniks: Yes.

Rebecca Veldon: So much to do and not a lot of

00:02:06

Tim Benniks: Yeah.

Rebecca Veldon: time.

Tim Benniks: We have this lovely task of replying about the whole internet exploding over Contentful

George Fitzgibbons: Mhm.

Tim Benniks: and um the big CRM and then

Rebecca Veldon: Yeah.

Tim Benniks: Yeah. Yeah. And like why not you guys and all that stuff because we're quite similar.

Rebecca Veldon: Sal

Tim Benniks: It's interesting.

Everett Zufelt: Absolut.

Tim Benniks: Whatever we say is going to be wrong. So, it's going to be a fun time.

Everett Zufelt: It I think you nailed it though. It It doesn't matter what. This is why I never want to be a politician because exactly half the people always disagree with anything you

Tim Benniks: Oh,

Everett Zufelt: say.

Tim Benniks: 100%. I was just thinking of posting like nobody ever wakes up thinking I want to buy a bit more Salesforce this year. Maybe that's what I'll post, but then I'm not sure my CEO is happy with me. We'll see. What I do like is that I think they're probably noticing that having either just CRM data or just content is not enough to use AI to read to do really cool experiences.

00:03:07

Tim Benniks: You need both. And so maybe this is this is like the renaissance of headless CMS's now because content is now also important. I don't know. We shall see.

Rebecca Veldon: It'll be interesting to see what happens. But then it is with any merger or acquisition.

Tim Benniks: Yeah.

Rebecca Veldon: All right.

Everett Zufelt: Indeed.

Rebecca Veldon: Are you two ready to get started? Are we all good to go?

Tim Benniks: I think we are. Do we have everyone?

Everett Zufelt: I think we probably have who's joining.

Tim Benniks: Yeah, exactly.

Rebecca Veldon: I'm expecting more people to trickle in,

Everett Zufelt: Yeah. I only have one thing to ask to have added to the agenda today.

Rebecca Veldon: but

Everett Zufelt: Well, two things. I know George and Tim, you've got some broader thoughts to share to the team about uh about where we want to go. Um so I think that's one thing you were going to share. Only a very tactical thing I wanted well actually now I say I have two things I'd like to ask to add to the agenda.

00:04:09

Everett Zufelt: Um that first one uh A would love to just get the final thumbs up. We're good to go publish that article. be um an offer from for for those not familiar there's a project an open source project called agency agy because they forgot the letter E um but there's an open source project called agency uh it's like we'll call it like no more than a reference architecture it's an approach to building multi- agent systems it's out of the innovation lab at Cisco. um they'd be if if this group felt there was value at some point in time. Uh they'd be happy to come and just kind of give us a walk through of the project, why they built it, the problems they are trying to use it to solve. Um they're they're just an innovation lab and I think it's part of I want to say it's part of the Linux foundation like the project itself is part of the Linux foundation. So it's like real open source. Anyway, so those are those are my three things that I'd love us to to cover today if we can.

00:05:24

Tim Benniks: You had some fancy stuff. I think you showed me this before, right, friend?

Everett Zufelt: Uh yeah, I may have shared it yet in the past. Yeah. Anyway, those those are the three things that could be worth us having a conversation about

Daniele Stroppa: And I think they uh they presented as

Everett Zufelt: today.

Daniele Stroppa: well uh agency they presented as well at the um uh Chicago event uh

Everett Zufelt: All right.

Daniele Stroppa: April last year.

Everett Zufelt: Yes. Yeah. Yeah.

Tim Benniks: Oh,

Daniele Stroppa: Yeah.

Everett Zufelt: Yes.

George Fitzgibbons: This is cool.

Tim Benniks: cool.

Everett Zufelt: But then George and Tim take

George Fitzgibbons: Cool. Yeah. Um um top of mind for me and Tim tell me what you're thinking, but I we've really broken down the problem or the answer to the agent problem into five buckets. And I think the next technical step is to start executing on what those buckets look like. And so what we think makes sense is uh to kind of divide and conquer for lack of a better word and start seeing which bucket could be interesting to people in the group.

00:06:28

George Fitzgibbons: And I think an output would be at the highest level a diagram of what for an example uh let me just read one uh like LLM assisted workflows like what does that look like in uh an actual implementation and then an added would be like an open- source example of that if you wanted to do hands-on keyboard and so I

Everett Zufelt: Oh,

George Fitzgibbons: think to kind of kick that off Um, I'd love to hear like what you guys think about that output and then uh any interest in particular what are we calling them? Buckets, I guess. Buckets.

Tim Benniks: I like I kind of like buckets.

George Fitzgibbons: Uh,

Tim Benniks: It's kind of nerdy.

George Fitzgibbons: yeah. Sign me bucket. Put stuff in it. Um,

Daniele Stroppa: I'm biased towards buckets,

George Fitzgibbons: so yes,

Daniele Stroppa: so that's good.

Tim Benniks: Yeah,

George Fitzgibbons: that makes sense.

Tim Benniks: let's do that because it also means you can add more into it or remove some from it.

Everett Zufelt: Oh,

Tim Benniks: It kind of works.

Everett Zufelt: I like I like that you can buckets hold things.

00:07:29

Tim Benniks: Yeah, it's

Everett Zufelt: Buckets hold things.

Tim Benniks: cool.

Everett Zufelt: The fancy word Claude came up with was archetypes. Uh but I think bucket is more relatable.

Tim Benniks: Archetype is kind of fancy though. No,

Everett Zufelt: It is very feels almost too fancy.

Tim Benniks: I prefer buckets. Yeah, it is. Um, and also George, what we discuss what I really am where we're both probably most excited about is like if we all go to Amsterdam if we get the chance that we actually do a workshop where we show this stuff like in real life. Like there might be a whole room of somewhat technical people that are excited about agents or people that are still

Everett Zufelt: Yeah.

Tim Benniks: learning and we actually build them and we let groups do it and present and then see how

George Fitzgibbons: Yeah.

Tim Benniks: differently they do it but also in which bucket they might fit and we might get some people that think much more out of the box than us because they're less technical and suddenly they build something in bucket five.

00:08:20

Tim Benniks: Like I'd love to see that.

Everett Zufelt: I I think I think it's part of the the conversation we had the other day, uh George and Tim and I. I think that's actually the part I I get the most excited about.

Tim Benniks: It's

Everett Zufelt: Uh like if we think about this as like a series of tasks that go on forever,

Tim Benniks: time.

Everett Zufelt: I think it's hard to get for me at least to get as much energy around it. But if we set like the goal like our milestone goal is we'd like to whether the day before, the day after or during MockX Amsterdam, I think the goal is how can we actually build toward like a a hackathon day where we're going in and teaching people about these five buckets, what each one of them's good for, what the implications are, and you know, when to use them, when not to use them, but then like hands-on keyboard, we're going to teach you how to build a bucket two and a bucket four and a bucket five. Like, we're we're going to build some things together.

00:09:20

Everett Zufelt: And I think that to me if like the goal for the next call it five months

George Fitzgibbons: This is

Everett Zufelt: is how do we build up the reference

George Fitzgibbons: action.

Everett Zufelt: materials, the points of view, the programming to do a hackathon day around agent architecture at MockX Amsterdam. also gives me a reason to justify going to Amsterdam, which hey,

Tim Benniks: There you go.

Everett Zufelt: selfishly sounds like a great thing to

Tim Benniks: Yeah, but that's the cool thing and I would love it if it works. If if people do these hackathon things, they go back to work and they have something tangible to show their boss that really moves the needle for them because that's a lot of the things is like they give a lot of budget for AI but there's not that much coming out because they haven't done a workshop like this, right? And it would be even better if they can use the tools they already have and then we might be able to say, "Oh, but you use this one." Well, then you can only do bucket one till three or something like that.

00:10:22

Tim Benniks: I'm not sure that's a bit too intense, but it's interesting at least.

George Fitzgibbons: So cool with that I

Everett Zufelt: So, so I'm I'm just before we jump in, I'm curious from others on the call,

George Fitzgibbons: guess.

Everett Zufelt: how do we feel about that as like as like our Yeah.

Tim Benniks: Oh yeah, we know we are excellent.

Everett Zufelt: As our goal for the next, you know, five or six months, how do we feel about that as like a goal?

Danny Lake: f***.

Everett Zufelt: They'll define a program for MockX Amsterdam and then build to build

Danny Lake: f*** you.

Everett Zufelt: and then basically hands on build that program together.

Danny Lake: That was

Everett Zufelt: Awesome.

Danny Lake: good.

Everett Zufelt: And I think if we share that out,

Ryan Lunka: Yeah.

Doug Wessel: Personal.

Ryan Lunka: Do do you have a

Everett Zufelt: Rebecca, sorry, sorry. I think Rebecca, if we share that as our goal and our theme and our mission, I think it's also going to draw others in to want to collaborate as

Tim Benniks: Yeah, it's it's nice and short termish.

00:11:21

Rebecca Veldon: Yep, I'm happy with that.

Tim Benniks: So, Ryan, you were saying

Ryan Lunka: Uh maybe putting the cart or the horse.

Danny Lake: Okay.

Ryan Lunka: I was just curious um I agree with the idea by the way the buckets I like the like way this is categorized and I think it's a good construct for how you do a hackathon.

Danny Lake: Come on.

Ryan Lunka: Curious if um there has been thought yet into like if you were to do a workshop that went through all five of these or three of the five or whatever, what technology or technologies would you even consider for it? Because the risk that jumps out to me is trying to take these patterns that generally make very sense but getting lost in the minutia of all these individual ways that you might build these things that might lose the thread a little bit.

Tim Benniks: True. Yeah. I was thinking initially maybe we can find a sponsor to just offer their tax so everybody does it on the same thing. But that also then shows that if

we use let's say the AI gateway of forcell of course that fits but then if we did that it kind of feels like oh this is the way to do it which is not exactly the way because you can also do the same things on you know I think AWS just released something really cool for agents uh content stack released something just this week and so there's many and that's hard like how do we find something that's like neutral ground to still

00:12:43

Tim Benniks: do

Doug Wessel: Dude, I mean on the spectrum

Everett Zufelt: A and and let's not o and let's not overlook the politics part that it's probably part of it as well,

Doug Wessel: cycle.

Everett Zufelt: right?

Tim Benniks: a little bit.

Everett Zufelt: There's like Yeah. So like I think that's I think you are asking an excellent question.

Tim Benniks: Yeah.

Everett Zufelt: Uh I think I don't know the answer. Uh but I think what we can align on our principles.

Doug Wessel: Don't

Everett Zufelt: Do we want it to be all about one vendor?

George Fitzgibbons: Yeah.

Doug Wessel: worry.

Everett Zufelt: No. Probably right.

Tim Benniks: No,

Everett Zufelt: We want to be able to show off multiple vendors.

Tim Benniks: no.

Everett Zufelt: Um do but do we want it when people show up on hackathon day or whatever we call it? Do we want to spend the first hour of the day with everybody trying to figure out how to make things work? No. We also don't want that, right? So, I think we need to figure out what is a nice approach to, hey, here's the three or four tools we're going to be using today.

00:13:34

Everett Zufelt: Here's the easy button to get them set up. Like, I think we need to I think there's some principles we could probably all align around, but it will be a challenge to pull it off, I think.

George Fitzgibbons: Yeah,

Everett Zufelt: Yeah.

George Fitzgibbons: I have a couple quick thoughts of how I see the this played out in other scenarios.

Tim Benniks: 100%.

George Fitzgibbons: So one I would push that when we and I think maybe we can do some of this in the later the call sort of divide and conquer into buckets that there is a conversation between the buckets around what tools and a purpose-built diversity in what you're building with and so bucket one may use tools xyz bucket two and so like we don't have to be extreme with it but I think we should use that opportunity to highlight different tools. Then I think when it comes to the hackathon,

Tim Benniks: That's my first one.

George Fitzgibbons: it can be sponsorshipbased where the sponsorships who wants to lean in and if you lean in, you can, you know, the sponsors can kind of talk and say, "Hey, I'll take this part, you take that part and kind of just divide it up that way.

00:14:41

Tim Benniks: Yeah, I would say if we speak about all these buckets and how they might work and connect, we don't talk about implementation stuff or at least which partner would do it or how the tech works. We kind of just keep it a little bit higher level and make it very clear that you can do this with any sort of tool. Maybe that's important. Like you can call an API with 20,000 types of things. probably the same thing here. As long as we mention that we're good,

Danny Lake: I I was thinking this on this along the same lines,

Tim Benniks: I

Danny Lake: Tim,

Tim Benniks: guess.

Danny Lake: like the goal is to teach people what's possible, not necessarily teach them where to deploy it because that's going to be constantly changing, right? We're trying to like retrain the way people solve problems and the way they see problems.

Tim Benniks: Exactly.

Danny Lake: And this assisted workflow one is like a very simple to me it's like here's a bunch here's some CSV files uh on here in this GitHub repo that has common you know export of orders some products some content from your CMS synthesize it for me in this workflow and this is now someone's day-to-day that used to take five hours now takes half an

00:15:49

Tim Benniks: Yeah,

Danny Lake: hour like and then there's the

Tim Benniks: you can do that like a hundred ways. So, we just have to explain kind of

Danny Lake: deploy slashdeploy to versel slashdeploy to AWS deploy to

Tim Benniks: Yeah.

Danny Lake: Azure right like that to me that's how you build this agentic like when I use a repo I don't want to even read the read me I want to know what skills to start running to to start working so if we

Ryan Lunka: I think even building on that Danny I think there's and maybe it's a separate

Danny Lake: can

Ryan Lunka: deliverable so to speak that complements this but not just un helping everybody understand that there are these different patterns and they can be implemented a bunch of different ways but how to even assess given a set of technologies that you know if you're in an enterprise you might you have what you have you have Azure and that's what your option is or you

Everett Zufelt: That's what you got. I agree.

Ryan Lunka: have Google how do you how do you recognize what your

00:16:35

Everett Zufelt: Yeah,

Ryan Lunka: options afford you and what it looks like when you're looking through that lens

Everett Zufelt: I I I like I like that.

Tim Benniks: That's a really good

Everett Zufelt: I think that's got to be I mean that I think we would have to balance

Tim Benniks: one.

Everett Zufelt: programming between that type of we'll call that like education and then hey how do we get our hands dirty? But I think that part that question is the where where I know sometimes even our team fails. We go to talk to a customer like oh look at all these great amazing things and then they're like I can't use any of that crap so see you later. Right.

Tim Benniks: Yeah, I've heard that

Everett Zufelt: It's like right it's it's the the reality is everybody had you might tell me

Tim Benniks: many

Everett Zufelt: claw desktop is the best thing in the universe. We all use co-pilot and that's the way it's going to be for three years. So probably for 30 years frankly. So you know like tell me how to get the most out of what I've got tell me this other thing I'm never going to be allowed to buy.

00:17:35

Doug Wessel: Well, I'm just wondering as part of this the write up and I don't know any if we have a visualization

Tim Benniks: Yeah.

Everett Zufelt: I think

Doug Wessel: underneath this spectrum to show the tools the tools that

Everett Zufelt: so.

Doug Wessel: span the spectrum, you know, maybe NAD is on one and two,

Everett Zufelt: Yeah.

Doug Wessel: right? Or, you know, make up the tool.

Everett Zufelt: Yeah. And spoiler alert,

Doug Wessel: Um,

Everett Zufelt: you need an LLM provider all for all five, right?

Doug Wessel: yeah,

Tim Benniks: But Duke,

Everett Zufelt: Like Yeah.

Doug Wessel: like what are the prerequisites and the

Tim Benniks: it's a little bit dangerous to do them because but Duke,

Doug Wessel: tools?

Tim Benniks: if we if we miss one, it's it's a flame war.

Danny Lake: Is it

Doug Wessel: Yeah,

Tim Benniks: I've done that before with CMS comparisons.

Doug Wessel: I know. I know.

Danny Lake: okay?

Doug Wessel: Yeah.

Tim Benniks: Oh my god, I had the CEO of Story Block on the phone just because I made one article on my personal.

00:18:16

Tim Benniks: So maybe I don't know. I want to because we'll have these opinions, but it's a bit scary.

Everett Zufelt: I'm leading partnerships for the last five or six years. Every every time our somebody on our sales team posts on LinkedIn about something or other, inevitably some partner's like, "How come they didn't mention me?" Like, I I don't I don't know because it was six o'clock in the morning and they were writing a LinkedIn post and

Tim Benniks: Exactly.

Everett Zufelt: just calm down. They'll mention you next time. I promise.

Tim Benniks: No, but let's maybe not play that game. But something maybe bigger lines we can do,

Everett Zufelt: So I think I think the I think the I think it's I think there's a

Tim Benniks: of course.

Everett Zufelt: balancing point to be sure. Uh so two things fully appreciating the challenge of mentioning vendors by name. I'll go out on a limb and say the content is not meaningful if we can't mention vendors. Like it's it's very hard to make sense of if we only mention categories of things.

00:19:18

Everett Zufelt: Many of these categories are so new that if you're the learner that the content's

George Fitzgibbons: Please.

Everett Zufelt: being written for, if you only vaguely mention it by category, they'll have no earthly like CMS, great, everybody knows what that is, right? But like some of these categories are new enough that if we only mention it by category name, nobody's going to know what we're talking about. Um, I I appreciate the complexities that come with mentioning vendors.

Tim Benniks: Agreed.

Everett Zufelt: We're going to have to find a way, I suspect, to as safely and carefully as possible mention vendors. Using an agent framework and then not mentioning, for example, would become a very hard thing for people to follow along with. But I think but I think something Rebecca and I can take away as an action item is to get some perspective from from Holly and the broader team about what how they've seen us be able to do this as safe as possible in the

Tim Benniks: Yeah, that's cool.

Everett Zufelt: past.

Tim Benniks: Maybe we just mention the the the members and then it's easy.

00:20:28

Tim Benniks: Sorry, Danielle.

Daniele Stroppa: No,

Tim Benniks: Go for it.

Daniele Stroppa: I was just going to add one one way like to to work around that like non- mentioning or mentioning one vendor or the other is also we can just add a disclaimer that whatever list we make is not an exhaustive list and as things change there will be more tools, more vendors uh that that will fit in certain

Everett Zufelt: Yeah, I I agree because also even like three months after we've written the content,

Daniele Stroppa: categories.

Everett Zufelt: there will literally be more vendors that didn't exist, right? Like so the the the ball's always moving on this stuff. I I I think it's a it's a problem.

Ryan Lunka: Um,

Everett Zufelt: I appreciate the awareness of it. Uh we'll have to figure out a way to to just do

Ryan Lunka: this might be my American showing,

Everett Zufelt: it.

Ryan Lunka: but there's potentially an argument that you you actually kind of do want to establish that uh vendor power broker position as an authoritative source in the middle of all the vendors and build an incentive structure such that they all want to be included on your list and potentially have um requirements about why do you get included on this list and it's evolved into more of a neutral third party but vetted almost like analyst type of perspective on where you can do all these types of things.

00:21:43

Everett Zufelt: Well,

Ryan Lunka: Um that makes it more valuable,

Everett Zufelt: it's an interesting it's an interesting viewpoint.

Ryan Lunka: right?

Everett Zufelt: Why wasn't I included? Well, do you really want to have that conversation? Because we're happy to have that conversation.

Tim Benniks: We had that a lot with

Everett Zufelt: We we reached out. We reached out to your team three times to see if they wanted to collaborate with us.

Tim Benniks: CMS.

Everett Zufelt: They ignored every one of the attempts for us to reach out and that's why you weren't included. So it had Right.

Ryan Lunka: It's it's potentially more confrontational with partners or vendors,

Everett Zufelt: Yeah.

Ryan Lunka: but it potentially also creates a more valuable corpus of information for the

Everett Zufelt: But

Ryan Lunka: market.

Everett Zufelt: we reached out to you. You ignored us and said it wasn't worth your time. that now now 3 months later you're mad because you weren't included. We would happily include you in the next version of this. Do you have some time? No. All right.

00:22:32

Everett Zufelt: Well,

Tim Benniks: But this kind of sounds like post that event. I don't think we are deep enough in to even talk to

Everett Zufelt: yeah. I I honestly I think we'll solve for this.

Tim Benniks: people.

Everett Zufelt: The mock alliance has been solving the polit the political dance of naming or not naming different vendors of different things for years.

Tim Benniks: Yes. Agreed.

Everett Zufelt: We we'll we'll solve for this. I think I think so. I've I've by the way I've sent

a note to Holly saying we'd like to do this. So, first things first, got to get Holly to say, "Yes, this fits well with the program." But provided we get Holly's blessing, then I think maybe for George and Tim, what we need to do is build. I think the the takeaway would be how do we define a program? Because once once this group defines what that program looks like, what that day looks like, then the work between now and then is just building all of the tools, opinions, slides, open- source code thingies, whatever in order to run

00:23:31

Tim Benniks: Uh,

Everett Zufelt: it.

Tim Benniks: we also need producer for on scene because that's pretty hard to do. But we have the mechallians to help us with that I imagine.

Everett Zufelt: Well, that's what I'm saying. That's why I'm going to get Paulie's like buy in and thumbs up,

Tim Benniks: Yeah,

Everett Zufelt: right?

Tim Benniks: exactly. Yeah. So if we start working on these different buckets, we kind of figure out what we want to write about them, how we define them, maybe some opinion pieces separate from it, and then some how you might implement this. Once we have that in, it's going to be relatively easy to then make that um that day happen, right? We just But we might need to come up with some use cases. But ever, didn't you say there's another group for these use cases?

Everett Zufelt: There's a second working group. Yes. They're focused on agent adoption and operations. So they're not thinking about technically how do we build an agent.

They're thinking about uh the way I try to frame that one for everybody is uh if I had a magic wand and I could give your company every agent it needed, what else would you have to do to be successful?

00:24:40

Everett Zufelt: They're working on the answer to what else?

Tim Benniks: Yeah.

Everett Zufelt: So, how do you get the team to even understand what agents are good

for?

Tim Benniks: Okay.

Everett Zufelt: How do you how do like like we talked about, how do you address the having to work with what we've got problem? How might roles need to change? How might reporting need to change? How might your annual reviews need to change to incorporate, you know, an assessment of how well is that team member adapting to a world of agents?

Tim Benniks: How many tokens did they burn?

Everett Zufelt: How how many tokens do they and is more better or is more worse? You know those are the questions.

Tim Benniks: Yeah, except it's going to be super interesting. Okay, so we can but I don't think we should wait for them to have that finalized because we we kind of just need to go now,

Doug Wessel: Um,

Tim Benniks: I think.

Doug Wessel: yeah, I think Tim, I think you're right. We need use cases and to me to make it most relatable to understand the spectrum and the buckets they need to be related to some degree like like a

00:25:36

Tim Benniks: Oh yeah, maybe there's one story, right?

Doug Wessel: through line right at least maybe several through lines but like I I forget the

Tim Benniks: Yeah.

Doug Wessel: example the CMS and product Excel spreadsheet that Danny mentioned but like taking that from bucket one through five I don't

Tim Benniks: Yeah. And that can even we can start earlier like you can like how do you have it in the CMS and then get it out of the CMS into the CSV like and suddenly that's you can do five buckets just on that part I think. So there's quite a

Everett Zufelt: I I I I like I like that concept because uh when I was learning different software frameworks,

Tim Benniks: lot

Everett Zufelt: which you don't have to learn anything now, I just tell Claude to do it for me. But when I used to have to think uh I really liked it when people would do like their training courses as like the progressive git repository thing right where it's like in folder A this is exercise one where it's like the simplest dumbest way of doing the thing and

then folder B or whether it's through folders or tags or whatever where you're progressing through that git repository and they're layering concepts on.

00:26:39

Everett Zufelt: I I always found that worked really well for me.

Tim Benniks: And we can do something like this, right? Maybe Danny, you can lead that or at least the the

Danny Lake: Yeah.

Tim Benniks: story.

Danny Lake: No, I mean like in my head it's like steps one to five to go through each of those uh you know tiers of of agentic uh demos and you know the tools the data that that the agents rely on input or or output is just MCP tools that we've stubbed with

Tim Benniks: Yeah,

Danny Lake: fake local data from a CSV and it's like here's your CRM data here's your

Tim Benniks: it can just all be pink. Yeah, sure.

Danny Lake: email data point it connect this tool to it. Or if you're on commerce tools, just use their commerce tools MCP server for products. If you're on contentful, use their MCP. And to me, it's like completely vendor agnostic because the data is usually,

Tim Benniks: Doesn't

Danny Lake: you know, a product's a product, an email is an email, a customer is a customer, it's going to be from a tool anyways.

00:27:41

Danny Lake: So,

Tim Benniks: really matter.

Danny Lake: build this fake fake set of MCP servers and and and scale them out with complexity as

Tim Benniks: just Jason nowadays or

Danny Lake: you go through the through through the cases.

Tim Benniks: Mark.

Danny Lake: The first one just uses a DOM uh synthesizer LLM call and that's the demo. The second one, there's some uh autonomous decisions being made and and you go on from

Tim Benniks: I think the one thing we should worry about a little bit is the RI ICP because not everybody has the same angle on

Danny Lake: there.

Tim Benniks: these type of problems and what they do daytoday. Like in my job, I would never touch a CSV like that. I would be more on the MCP API side. So if the whole example is that, but I'm not there. Like I'm technical enough now to envision it, but maybe not everybody is. So that's the hard bit.

Danny Lake: So the the CSV is just sitting in front of what would be an API call.

Tim Benniks: Yeah.

00:28:30

Tim Benniks: Yeah. Sure.

Danny Lake: All

Tim Benniks: But I just wanted to make the example that we have to somehow highlight most people's dayto-day

Danny Lake: right.

Tim Benniks: in it.

Ryan Lunka: I worked with a lot of supply chain people that won't be able to make that connection.

Danny Lake: Yeah.

Ryan Lunka: They just deal with ESP imports from vendors all day, every day, and that's it.

Tim Benniks: Yeah. And other people care about how my header is styled. Now, there's a there's a real different person, but it might be really the same chain because you can get that CSV and then put it on a page, but that person that dealt with the CSV really doesn't care about how that header looks, but there's a whole bunch of marketing executives that do, right? So we kind of need to make it somewhat wide and then apply these agent.

Doug Wessel: Everyone everyone needs to care about everything now,

Tim Benniks: True.

Doug Wessel: right?

Tim Benniks: True. But that's not the case

Doug Wessel: I mean, you're you won't Yeah,

00:29:16

Tim Benniks: yet.

Doug Wessel: you're maybe you'll be a little specialized in some areas, but like I think we're kind of opening the box here a little bit that you kind of have

Tim Benniks: That could be a story too,

Doug Wessel: to care about everything.

Tim Benniks: by the way.

Doug Wessel: Yeah.

Danny Lake: Maybe maybe in each each uh category of like one to five we have an internal facing use case and a external facing use case and and that might give us like the most amount of overlap uh or not maybe the least amount of like overlap of uh addressing

Tim Benniks: Nice.

Danny Lake: only one or two you know target audience and and then you got most people care about how can I use this for my customers if you're if you're in marketing or something or selling products or if you're in back of staff operations you know you want to make your internal teams faster. So I feel like that could be a good wide net to cast where we have two use cases for

Tim Benniks: Yeah,

Danny Lake: each because it would be

00:30:12

Tim Benniks: that sounds great to me.

Danny Lake: cool to have some kind of you know contentful CMS data change to showing it work in your browser if

Doug Wessel: Do we think about it maybe from like a a department departmental

Danny Lake: if

Doug Wessel: role? Not the role but like department. So for instance uh a marketing use case end to end um a supply chain use case right where you know I don't know uh product data you know is the core there not the content data but at the you know on the level five of the spectrum or level five bucket you're um I don't know automatically responding and communicating with vendors or whatever the use case was. But from a marketing perspective, it's a totally different use case, but you're still going through those five levels that pertain to people that are marketing savvy.

Ryan Lunka: I I think you could treat this as an just like an open source code project,

right? If if this GitHub has a construct per when you're defining a use case for one of these categories, here's what it looks like and maybe it's seeded with some examples across all the categories.

00:31:35

Ryan Lunka: And even this group just continually adding over time, you can build a pretty good uh cross industry, cross functional area body of examples that should still have, you know, a pull request and vetting process. So we're getting make sure they're good examples, but like that could organically grow where it needs to versus trying to presuppose where all these use cases need to come from.

Doug Wessel: It actually got me thinking like could you just build a skill that took a an input and it broke it into five levels. So here's your business need, the intent that you're trying to drive and it categorizes them into the five buckets because we've clearly defined what those five buckets are as part of this work

Tim Benniks: Yeah, let's do the whole thing as an agentic workflow.

Doug Wessel: stream.

Tim Benniks: Anyways, I I love the meta of that.

Danny Lake: some mock

Tim Benniks: Let's do it.

Doug Wessel: Yeah.

Ryan Lunka: as the consultant who's theoretically, you know,

Doug Wessel: So like

Ryan Lunka: build build customers to do that.

Danny Lake: skills.

Ryan Lunka: I'm not sure I love it, but we'll mark it

00:32:35

Doug Wessel: sorry that industry is going to change I

Tim Benniks: Oh, we have to practice what we preach at least.

Ryan Lunka: up. How's that?

Tim Benniks: But like we do need to practice what we preach though, right?

Ryan Lunka: Yeah, I'm totally kidding.

Tim Benniks: But honestly,

Ryan Lunka: That's a great idea.

George Fitzgibbons: Yeah,

Tim Benniks: yeah, let's run.

George Fitzgibbons: I know.

Tim Benniks: But we do need to start with I think these five buckets and like we have the article now and ever

George Fitzgibbons: Yeah.

Tim Benniks: like I I thought I had some feedback but I reconsidered it's actually fine as is. We just have to see if we like the writing and the style and then just publish it and then from there we need to make much more specific definitions on these buckets. write them up like it's a real this is like our wiki of this is the you know the core source of truth and then addu user or these journeys to it and so George how how are you thinking about that content what should it be is it like this is our definitions like it looks like a confluence page almost with like this is it this is our glossery or do we attach opinion pieces like what do we

00:33:38

George Fitzgibbons: Yeah, I think there should be some boilerplate to it, but there should be latitude in defining what's in there. And again, kind of to that idea of dividing and conquering the group kind of taking that. And for me the boilerplate and I like the idea of adding a still uh but would be like at base would be just boxes you know pure market use companies don't use companies you know I think that that's to the that's flexible but there's some sort of definition some sort of architecture view and then some sort of tangible output and Ryan I'm what you're talking about is what I think too with the open source kind landing repo where you can go through and look at it. But I think this would be the jumping off point. So take bucket one for instance.

Tim Benniks: Yeah.

George Fitzgibbons: Here's a definition. Here's a rough diagram of what that can look like. And here are a couple of examples and bonus points if you add in a skill or more content.

Tim Benniks: Yeah.

George Fitzgibbons: But I think if we divide and conquer and create five of those, then we have some pillars to stand on where if we want to jump off to a hackathon, we want to keep building out the repo, we kind of have that base of definitions and it's also a lot of content,

00:34:57

George Fitzgibbons: too. So, you

Tim Benniks: You need the content also to share show the opinion and also I think when we all have

George Fitzgibbons: know,

Tim Benniks: done it and we come back together we can do a workshop on what they all have in common and all the things we've written so we can make that more templated

George Fitzgibbons: Yeah. Um, and not to put the Does that make sense to everybody?

Tim Benniks: after.

George Fitzgibbons: Are people into doing that? Like the one thing is like I want to sign people up for work. Uh, but is would this be a fun thing to do?

Daniele Stroppa: Good.

George Fitzgibbons: And then fun is relative.

Daniele Stroppa: Yeah.

George Fitzgibbons: Who knows? Uh but then the other aspect is what the one thing I'll throw out is since you guys are here like do you guys want to take like first pick on uh what bucket you want to work on? Like does anybody have a preference on like one through five? I'll sign myself up to work with anybody.

00:35:52

George Fitzgibbons: Uh so like anybody bucket like I'll join their team for lack of

Everett Zufelt: My my claw code bucket is happy to work with anybody else's claude code

George Fitzgibbons: better.

Tim Benniks: I think my strength is probably in the first three.

Everett Zufelt: really.

Tim Benniks: I'm not as visionary as others, but that doesn't matter. I can try to be visionary. Just ask

George Fitzgibbons: Well,

Everett Zufelt: Um,

George Fitzgibbons: I guess we can pose Slack, but before

Tim Benniks: Claude.

Everett Zufelt: yeah. Um, I was c I want to make sure I captured this well. I like I if maybe as people are pondering your question because I think that's

George Fitzgibbons: they

Everett Zufelt: important. I tossed in Slack what I think I heard us say. Uh, Danny knows sometimes I think I heard what I wanted to hear.

George Fitzgibbons: come

Tim Benniks: Oh, me too. It's

Everett Zufelt: So, um, just take a peek there and let me know.

Tim Benniks: fine.

Everett Zufelt: Did I capture our proposal right? because I want to make sure that when Rebecca and I bring it back to Holly that we've captured it properly.

00:36:49

Everett Zufelt: Oh, I forgot to add in the part about like like implications within your current tech stack. I'll add that in.

Tim Benniks: Yeah. So based on what I read here, maybe the first part of that workshop is just us explaining it or do we ask people people to do the homework?

Everett Zufelt: people will not do the homework.

Tim Benniks: No. No, I know.

Everett Zufelt: Um, some so some will do the homework.

Tim Benniks: But still too much homework.

Everett Zufelt: Assume assume that when people show up enough of them will not have done the homework that that's your assumption.

Tim Benniks: Yeah. Yeah. Yeah. Okay.

Everett Zufelt: Yeah. But just I I just wanted to get like a quick because again Rebecca and I have to go get the group to sign off. So, I just want to make sure that I'm getting them to sign off on the right thing.

Tim Benniks: I would add that the the people that actually joined the hackathon actually built something tangible to bring back to work that moved the needle for their job ro that's a really nice output to pitch.

00:37:53

Tim Benniks: I guess

Doug Wessel: That means they need to we need to be using real scenarios that they're given by the

Danny Lake: Okay.

Tim Benniks: I don't know. Yeah.

Doug Wessel: users.

Tim Benniks: Like if we are not mature enough now in us knowing if this actually works like super

Danny Lake: Oops.

Tim Benniks: well maybe it almost feels like the second hackathon we can just literally have people walk up and say I want to do this and then say oh that's bucket three let's go or you go here you here's your skill you know but I don't think we're mature enough for for that yet.

Ryan Lunka: That requires a pretty good facilitator, too, trying to like on the fly react to the audience.

Tim Benniks: Yeah,

Ryan Lunka: I mean, it's it's akin to a a comedian that does crowd work, right? Like,

Tim Benniks: but we have agency folks here.

Ryan Lunka: you got to be really good.

Tim Benniks: We can do that. Like I'm doing that three days after on the content stack conference that we'll actually have people say I want to do this thing and on stage I'll do it.

00:38:49

Tim Benniks: I'm going to be very scared because yeah like we need

Rebecca Veldon: I do like the addition of it though.

Tim Benniks: to show that this is actually usable. And in this room, there's people with different skill sets, but we're all quick on our feet. We can all speak well. We all understand from experience what people might want to build. So, whatever question anybody now adds in here, either about something technical or some use case for a website, I'm sure we all have an opinion on how to potentially build that with a skill or right,

Everett Zufelt: So,

Tim Benniks: we could

Everett Zufelt: so I just added a goal statement at the top which roughly says like the goal is that the participants will learn what is an agent, learn about the different you know architectures or or levels of complexity for building them and get hands on experience and something to bring back to their team.

Tim Benniks: That's the way.

Everett Zufelt: I think that emphasizes the hands-on part and yes you will have

Tim Benniks: Yep.

Everett Zufelt: something to bring back to your team.

00:39:47

Everett Zufelt: Now will you have solved a problem your team has? Maybe, maybe not. But, you know, some people will be in the corner hacking away on solving a problem their team has and ignoring half of what we say, and that's perfectly fine.

Tim Benniks: I like that because then they're actually doing it,

Everett Zufelt: Or some people and some people will just paint by numbers,

Tim Benniks: you

Everett Zufelt: and that's fine, too. But at the end of the day,

Tim Benniks: know.

Everett Zufelt: they'll have something they can go back to their boss and say, "Oh, s***, look at what I learned.

Tim Benniks: You know, this is one of those like I had one of our customers on the phone and we're talking a little bit about maybe wanting to do this hackathon and he's like, I have a thousand ideas but I don't have time. Can I please take four hours just sit in the back and with you learn and do at the same time? And so if we had a few of those, they they'd be very happy. Most more senior people already kind of know what they want.

00:40:32

Tim Benniks: They just need a little bit of help and some

Everett Zufelt: I agree. So if this proposal is, you know,

Tim Benniks: time.

Everett Zufelt: 80% right, Rebecca and I will go make the argument for getting it in play. Um, but then George, your question was an important one. I just wanted to make sure

we I can go unblock the next block for you, which is who wants to work on what part of it. My my answer is I am personally more inclined to work toward buckets four and five. I just find them interesting personally. So I'm more inclined toward the buckets four five zone.

Tim Benniks: Yeah.

Danny Lake: We've worked with agency to build multi-

Tim Benniks: The big

Danny Lake: agent systems using their agency's open source framework.

Tim Benniks: thinking

Danny Lake: So I would I would also be leaning towards five five and four. Um, five is more of the multi-

George Fitzgibbons: Danny,

Danny Lake: agent system. Yeah,

George Fitzgibbons: you're locked in for five with

Danny Lake: George.

George Fitzgibbons: Everett.

00:41:30

Tim Benniks: done cuz I like sometimes I am so into tech I need to take

Danny Lake: Perfect.

Tim Benniks: like 25 steps back to even think about what a five would do and then once somebody pitches a five is like oh Of course. So easy. Sure, that makes sense. But that's everybody's

Danny Lake: Do you guys do you think we should like homework for next

Tim Benniks: different.

Danny Lake: session is come back with like a use cases in each bucket. So first of all figure out which bucket we're going to work in and then come back with like two or three use cases that we all walk each other through and we kind of vote

Tim Benniks: Do we want to do a use case and then a definition together or do you want a definition on your own as

Danny Lake: on

Tim Benniks: well?

George Fitzgibbons: I think any homework to the bucket would be good.

Tim Benniks: Yeah, whatever to that bucket

George Fitzgibbons: Uh

Danny Lake: Yeah,

Tim Benniks: works.

Danny Lake: if you could try to break come back with two or three good use cases in in one of the buckets that and then we can I think that'll help everyone

00:42:22

Tim Benniks: It's a great start.

Danny Lake: understand, right? And then we can figure out what does the agnostic GitHub repo look and feel like for that

Tim Benniks: Yeah,

Danny Lake: use case.

Tim Benniks: I'm pretty sure we won't nail it first time with the definition because it's so changeable. Like we could do a workshop at one point if when we all have all these work these these use cases. We can just like do one of those workshops where you have like sticky notes where everybody writes their thing and then you group them together and see hey what is closest and that's some sort of a consensus we can

Danny Lake: No, we don't come back with new cases for each category.

Tim Benniks: make.

Danny Lake: I mean, because that would be hard to wait through, but you know, each of us gets one or there's, you know, eight of us here and there's five categories. So, there's going to be two people in some of those groups.

Tim Benniks: I was talking about definitions, not use cases, because that would not be workable indeed.

00:43:18

Danny Lake: What's your what's your difference between a definition and a and a use case for these

Tim Benniks: A definition is like one good sentence that that covers what this thing is and what it's

Danny Lake: buckets?

Tim Benniks: not especially because the difference between a two and a five is pretty big. So if I read a two, I need to exactly know what it is and then the use case explains that one sentence with more context.

Danny Lake: To me, I I feel like a use case helps me understand what it is. Like you give

me the definition of something,

Tim Benniks: Of

Danny Lake: cool. But to me, I just my brain works like I need to see real examples of what that looks and feels like.

Tim Benniks: course, that's why we need both

Danny Lake: Yeah.

Ryan Lunka: So when I look at the what is a what is an agent document though like what I feel like those

Tim Benniks: because

Danny Lake: Yeah.

Ryan Lunka: buckets all do have definitions. What What are you hoping to expand upon there?

Tim Benniks: I don't know.

00:44:08

Ryan Lunka: Like

Tim Benniks: I feel like maybe we need to ex make them a bit bigger and then when

Ryan Lunka: what

Tim Benniks: we explore what we added maybe that wasn't necessary and then we trim it down again. So it just that that thought experience like if everybody does it that helps because Danny I'm going this way because if we now talk to Gartner they're going to just paste that definition and then show a use case. They're going to do both. So we we're going to have to have that like these use the the definitions are quotable things also and so they kind of need to stick and I'm like you more like I would prefer the use cases but I have also learned there are so many people that think differently in terms of how would I implement something that the definition we probably needed both to be able to really nail it down.

Danny Lake: So, are you saying the definitions in the work in the repo right now are not clear or good

Tim Benniks: I think they're pretty good, but we might have to expand on them a little just to see if we all think about them.

00:45:06

Danny Lake: enough?

Tim Benniks: And you know, if you guys don't agree, we just keep what we have and have ever first draft as our final document forever. I'm a bit like I kind of want people to think about it a bit more.

Ryan Lunka: And I suggest one thing that might be helpful to expand on what's here to be a little more precise. I think a picture of each of these that sort of like abstractly talks through this the decision logic that's being described I think would add to what's here at least for me seeing the picture next to the words is helpful for my brain

Danny Lake: I feel like the definition is the definition plus use cases with pictures.

Ryan Lunka: um

Danny Lake: To me,

Tim Benniks: Yeah.

Danny Lake: that's like

Tim Benniks: So those three together is literally the whole thing. And it they can be as short as we want,

Danny Lake: Yeah.

Tim Benniks: of course.

Ryan Lunka: what's cool about the picture too if you define it generically for the pattern first and then you take the use case. You can kind of do a paint by numbers thing where you're like here's the generic use case picture,

00:46:04

Tim Benniks: That's

Ryan Lunka: but we're talking about customers and evaluating who's going to be a good fit for this promotion,

Tim Benniks: cool.

Ryan Lunka: right? And then you can kind of fill in what that looks like with this pattern a little bit more

George Fitzgibbons: There's the template. It sounds like definition,

Ryan Lunka: precisely.

George Fitzgibbons: picture, use case.

Tim Benniks: Nice.

Danny Lake: And 100% agree Tim these definitions they they can change that like they will change probably right but

Tim Benniks: Likely.

Danny Lake: but I think we already have a solid set of definitions so now it's like don't stop iterating on

Tim Benniks: Yes.

Danny Lake: those go to the next like you're saying George picture use cases and then we can be like okay we have the pictures and use cases now should we update the definition

Tim Benniks: Well, that that's fine. Yeah,

Danny Lake: slightly.

Tim Benniks: that works.

Danny Lake: Okay. So I think buckets who who we need to fill in homework for next time to for

George Fitzgibbons: Mhm.

Danny Lake: each

Ryan Lunka: I'll take three since everybody wants to go on the the ends of the

00:46:57

George Fitzgibbons: Yeah.

Danny Lake: bucket

Ryan Lunka: spectrum.

Tim Benniks: Yeah, I'll go on the other

George Fitzgibbons: Okay.

Daniele Stroppa: I can do four.

Tim Benniks: end.

George Fitzgibbons: All right.

Tim Benniks: Let me just look at the diagram again.

Doug Wessel: pick up with four as

Everett Zufelt: So hopefully somebody's hopefully somebody's doc hopefully somebody's documenting this so I don't forget what we don't

Doug Wessel: well.

George Fitzgibbons: I just started writing down and I'll

Everett Zufelt: forget what we said.

Tim Benniks: We we are reporting also right the

Everett Zufelt: Oh, there you go. That's true. You can if there's It sounds like we've got a bunch in four.

George Fitzgibbons: I'll

Rebecca Veldon: We call the infoscoring.

Tim Benniks: transcription.

Everett Zufelt: So maybe I think we've got a bunch in four. So Danny, why don't you and I just pile on five and we Yes.

Danny Lake: Yeah.

Tim Benniks: I'm so excited to see what we came up with for

Everett Zufelt: And and we're going to cheat and get the And we're going to cheat and ask the Cisco guys to help us.

00:47:38

Tim Benniks: five.

Doug Wessel: It's

George Fitzgibbons: Yes,

Everett Zufelt: So Perspective.

George Fitzgibbons: we'll ask uh I'll put it in Slack,

Doug Wessel: perfect.

George Fitzgibbons: the rough one, and Doug, you want to go three or four? Okay, cool. And then yeah, we'll fill out the rest in Slack and then kind of post that.

Tim Benniks: Yeah, I'll go one and two.

George Fitzgibbons: Oh, yeah. You're gonna do one or

Tim Benniks: Yeah, because then we have at least we have cover

George Fitzgibbons: two

Tim Benniks: coverage.

George Fitzgibbons: and yeah, I'll kind of pose

Doug Wessel: Okay.

Tim Benniks: I might do three also because we'll see. We'll have more overlap with everyone and then we make one thing out of

George Fitzgibbons: Cool.

Danny Lake: I guess like we said, we would want a cohesive story that grows.

Tim Benniks: it.

Doug Wessel: Yeah.

Danny Lake: throughout the five stages. So we come back with all of our use cases are going to be totally different and then it's like how can we align those use cases to m to to create a narrative of

00:48:26

Tim Benniks: Is there something now?

Danny Lake: growth.

Tim Benniks: We Sorry,

Doug Wessel: I think though if we sorry if we get that template of what do we say the

Tim Benniks: we gone

Doug Wessel: definition the picture the use cases um I mean that's feeding what

Tim Benniks: duck.

Doug Wessel: could be this skill to um define the the different buckets by a person's input

Tim Benniks: Oh, that is dynamic. That's interesting.

Doug Wessel: it but it revolves around having a good definition like that has to be that's to me that's like

Tim Benniks: Yeah, true.

George Fitzgibbons: Yes.

Doug Wessel: the first step if we can obviously we have the definition but putting that generic uh visual diagram

Tim Benniks: Yeah.

Doug Wessel: putting those uh example use cases to train you know further train what our definition ultimately this.

George Fitzgibbons: I think maybe just to officially or say it like I think whatever saying is once like the group starts working on a bucket I feel like they have full autonomy to change the definition.

Tim Benniks: I agree. Yeah, why

George Fitzgibbons: So once you get into the weeds working on your bucket,

00:49:33

Tim Benniks: not?

Doug Wessel: As long as it doesn't creep.

George Fitzgibbons: just like don't make a new bucket from your

Doug Wessel: Yeah.

Tim Benniks: Who have mine? Now, Danny, what you're saying is actually makes a lot of sense because we all come with different use cases.

George Fitzgibbons: definition.

Tim Benniks: kind of doesn't fit. Is there like one angle that we think fits most Mac

Alliance partners? Maybe like a commerce kind of thing because that could include content, customer data, content and data, BIM stuff, workflows. Like it feels like like everybody does that one, but we can do something around that, right?

Danny Lake: Yeah, that's why I was thinking like an internal use case and an external facing use case is like we each come with two of those. There's probably some rough overlap.

Tim Benniks: Yeah. But then in should we do it close to something with commerce then or do we do something else or

Danny Lake: What's

George Fitzgibbons: I like the I like the internal external face.

Danny Lake: everyone's

George Fitzgibbons: Uh because Yeah.

00:50:40

Tim Benniks: 100% agreed customer

Danny Lake: Everyone has customers,

Tim Benniks: data can be a thing for everybody

George Fitzgibbons: And

Danny Lake: right?

Ryan Lunka: You blur your eyes.

Tim Benniks: right?

Ryan Lunka: Every business in the world has customers, products, and orders.

Tim Benniks: Yeah.

Ryan Lunka: They might call them different

Tim Benniks: So maybe fine we keep it in that and it's good because Orium has

Ryan Lunka: things.

George Fitzgibbons: Yeah.

Tim Benniks: just produces stuff that then Yeah. So it's all kind of that. You're right, Ryan.

Danny Lake: Everyone has marketing, customers, purchases, right?

Ryan Lunka: Excuse

Danny Lake: If we stick around

Tim Benniks: It should be safe

Danny Lake: there.

Everett Zufelt: I'll I'll I'll share that Holly has given us a tentative

Tim Benniks: enough.

Everett Zufelt: slash provisional. Yes.

Tim Benniks: That's pretty fast. favorite blood

Everett Zufelt: like de details details pending formal approval

Danny Lake: Goodbye.

Everett Zufelt: budget approval like there's a lot of like pendings but there's a

Ryan Lunka: me.

Tim Benniks: yet.

Everett Zufelt: provisional this is a good idea and we'd like to see it happen not a stamp

00:51:32

Ryan Lunka: Huh?

Everett Zufelt: sees guaranteed absolutely but at least we're we're at least point the ship is pointed in the right

Tim Benniks: That's good. We also need to figure out how long we want this to be.

Everett Zufelt: action.

Tim Benniks: Like if it's a full day, we need to really be entertaining.

Everett Zufelt: Well,

Ryan Lunka: Yes.

Everett Zufelt: the nice part of a hackathon is that can fill whatever time is available, right?

Tim Benniks: Yeah, but like we cannot go through talking tracks of mainstage stuff,

Everett Zufelt: Like

Tim Benniks: right?

Everett Zufelt: Exactly. Exactly.

Tim Benniks: Yeah. So, it's not going to be super long, I think.

Danny Lake: If you go through five the five buckets in in in the hackathon A lot of room to play

Tim Benniks: Yeah, talking through them is pretty quick.

Danny Lake: with.

Tim Benniks: Explaining it, having people ask questions, that could be like the first hour and then the rest, maybe an hour is even too much.

Danny Lake: Hands

Tim Benniks: Yeah, the rest is just go and maybe we split it in two where there's lunch in between and people sit on their

00:52:29

Danny Lake: on.

Tim Benniks: laptops, do stuff and come back. That's all doable.

Ryan Lunka: If you had one use case that you could pull through all through five of them, it would be a really compelling narrative to be like, "Cool, let's build, you know, class one of these things. Now,

Everett Zufelt: I I I think there's I think there's a story.

Ryan Lunka: let's talk about what it can't do." Go

George Fitzgibbons: Okay.

Ryan Lunka: ahead.

Everett Zufelt: I think there's a story, right? I think it's like a single I'll toss another word out scenario because like I think you won't be able to do the exact same use case at every single stage but you could paint a picture of a scen of like a business scenario right here's how things work today very manual spreadsheets blah blah blah copy and paste between tools yada yada now what if we

Danny Lake: Oops.

Everett Zufelt: could just make one little part of that easier dot dot dot dot dot stage five what if it was all running itself so like I Think if we look at it like maybe there's many use case or multiple use cases but they live within the same scenario.

00:53:40

Everett Zufelt: So now I'm I'm not learning like new background, new context, new whatever every time. I think maybe that's the way like a scenario where the use cases can expand and evolve might be the way to get there because I like the idea of it being glued together. I just like bucket one and bucket five are so radically different that there needs to be something something to hold it together and also some way for it to be very

Tim Benniks: and the scope of the use case is going to be different for a one and a five.

Everett Zufelt: different.

Tim Benniks: Of course,

Everett Zufelt: Correct. But the scenario can be the

Tim Benniks: the one is a time thing potentially. Anyways, 6 minutes left. Not bad time wise. This is good time boxing.

George Fitzgibbons: Um, I'll send out the Slack with kind of first pick order that we we have going. I'll cue or I'll at the group to join the pick a bucket

Everett Zufelt: Yeah.

George Fitzgibbons: and join. And I guess if we can do a little homework, it'd be awesome the next meeting to come and say, "Here are the buckets. here are the people working on it and then to the point Danny if if that bucket wants to say here's

00:55:09

George Fitzgibbons: what we here's what we're thinking so far I think that'll be really helpful and be the jumping off point to say okay everybody knows what they're working on this is kind of the general format again boilerplate and then we spend that next two week block actually tangibly doing stuff and yeah marching down the

Danny Lake: If we could somehow share a common data

Tim Benniks: Oh yeah, I like

George Fitzgibbons: Well,

Danny Lake: set,

George Fitzgibbons: I didn't want to say this,

Tim Benniks: that.

George Fitzgibbons: but I love CSVs for this kind of format. So,

Tim Benniks: I'm not a CSV person,

George Fitzgibbons: uh I know like we want to

Tim Benniks: but it's all good. I just asked my AI to deal with it.

George Fitzgibbons: do

Danny Lake: we don't care about where data comes from,

Tim Benniks: It's No.

Danny Lake: right? We care about showing how an LM can use the data and what it can do with it,

Tim Benniks: All right.

George Fitzgibbons: uh quick plug agents

Tim Benniks: Of course. Of course.

Danny Lake: right?

00:55:55

George Fitzgibbons: work in sandbox is so good with CSVs. they the file systems they can just rip through them. Uh and so we could and I'm happy to take on like we could make a generic set of CSVs of like random data. We could do com we could do order

data. We could just I guess that's a good point. we can talk in the group to see on the use cases and an output of that is we can make a bunch of CSVs and throw them somewhere and that works good for the open- source projects because nothing's better than getting an open source project and having it actually work uh without API keys and all that. So yeah,

Tim Benniks: Yeah, agreed.

George Fitzgibbons: let's see CSVs are back.

Danny Lake: It it helps tie the narrative together.

Tim Benniks: There we go.

Danny Lake: If it's the same data set, it's like these use cases expand on this data set and each new category might include

Tim Benniks: Exactly.

Danny Lake: a new CSV because now you're expanding the scope like especially for level five where you're maybe talking about someone you're talking to someone else's agent and that agent represents a different data

00:57:01

Tim Benniks: Exactly. Yeah, that's cool.

Danny Lake: set.

Tim Benniks: Let's make it static in terms of data so we just have it and we can play with it. Cool.

George Fitzgibbons: Okay. Well, sounds good.

Danny Lake: Let's come back see what kind of crazy different use cases we come back with and then the challenge is putting those

Tim Benniks: Oh, I'm sure it's going to be different.

Danny Lake: together and do a story somehow. But yeah, like you said,

Tim Benniks: Perfect.

Danny Lake: the domain of customer orders, products is a good kind of framing of it.

Tim Benniks: It

Everett Zufelt: I've put a few um to-do items in the Slack channel.

Danny Lake: Yeah.

Tim Benniks: fits.

Everett Zufelt: Just let we don't have to do it now, but just let me know if I missed something, but basically the scenarios and use cases, the data. I'll I'll take a crack at a program agenda to share back to the group and then Rebecca maybe

Tim Benniks: Cool.

Everett Zufelt: you could help us by coordinating any questions back and forth with

Rebecca Veldon: Yeah,

Everett Zufelt: Holly.

Rebecca Veldon: I want to get in some time with Holly next week to talk about the working groups anyway.

Everett Zufelt: Yeah.

Rebecca Veldon: So,

Everett Zufelt: Cool. Awesome. FYI,

Rebecca Veldon: bye then.

Tim Benniks: Thanks everyone.

Everett Zufelt: I'll be in London on Wednesday. I think the only person in London is or near London's Rebecca,

Tim Benniks: All

Rebecca Veldon: Yes.

Everett Zufelt: but I'll be in London on Wednesday. Cool. All righty.

Tim Benniks: right,

Rebecca Veldon: Oh,

Tim Benniks: thanks everyone.

Everett Zufelt: Thanks everyone.

Tim Benniks: Exciting times.

George Fitzgibbons: Thank

Doug Wessel: Thank

Danny Lake: I guess.

Rebecca Veldon: what you see?

Danny Lake: Bye.
