Meeting records  Transcript

## Summary

Technical documentation alignment and hackathon planning established development guidelines for enterprise agent architecture projects.

### Documentation and Planning Alignment

Documentation for all 5 buckets reached full coverage following recent pull request merges. The team aligned on architecture diagrams and initialized a timeline leading up to the September hackathon.

## Hackathon Strategy and Logistics

The hackathon will feature an educational session followed by a build phase focused on identifying agentic solutions. Organizers will provide infrastructure and pre-event checklists to minimize setup time for participants.

## Technical Standards and Mandate

The group reaffirmed the enterprise agent architecture mandate while debating the technical trade-offs of WebMCP protocols. Participants finalized requirements for attendees to ensure focus remains on security and high-level patterns.

# Decisions

## Aligned

- **Hackathon format structured in two parts** The hackathon is structured into two parts: an educational session defining the buckets and framework, followed by an open session for participants to build their own projects.
- **Three use cases provided per bucket** The hackathon will provide three example use cases and sample data for each bucket, while allowing participants the flexibility to apply their own relevant problems.
- **Enterprise-focused hackathon target audience** The hackathon audience is intentionally targeted at technical individuals responsible for enterprise systems, rather than general marketers or non-technical roles.

We've **updated the Decisions section** using your feedback.

Let us know what you think: [Helpful](#) or [Not Helpful](#)

## Next steps

- ☐ [The group] List Use Cases: Compile 3 internal use cases for each bucket to support the hackathon. Provide example commerce data to help participants test their work.
- ☐ [The group] Create Prerequisite Guide: Document technical requirements including software and library installations. Distribute the guide to ensure participants are prepared to build agents during the event.
- ☐ [The group] Build Selection Skill: Develop an installable tool that guides users in selecting and initiating their agent bucket. Package the utility within the project repository for easy access by attendees.
- ☐ [Rebecca Veldon] Hackathon Sponsorship: Contact Holly to investigate prospective sponsors for the hackathon and identify any associated technology requirements.
- ☐ [George Fitzgibbons, Tim Benniks, Everett Zufelt] Build Backlog: Populate the GitHub repository with tickets defining prerequisites and goals for the event. This will provide a structured list for contributors to pull from.
- ☐ [Everett Zufelt] Create Deliverables Folder: Add a specific directory within the GitHub repository for all hackathon related documentation and items.

## Details

- **Social Introductions:** The meeting began with the participants, including Everett Zufelt, Rebecca Veldon, Danny Lake, and George Fitzgibbons, exchanging personal updates regarding travel, recent weddings, and upcoming honeymoon plans ([00:00:13](#)). Rebecca Veldon shared their excitement about visiting Italy and their ongoing project of booking transportation for the trip ([00:01:58](#)).
- **Technical News Updates:** Tim Benniks initiated a discussion regarding a technical update from Mistral on Hugging Face, noting a large model size that caused confusion regarding server costs and storage. The group discussed the potential for these figures to represent training corpora rather than parameter counts, with Everett Zufelt noting that the provided information seemed incomplete ([00:03:06](#)).

- **Project Documentation and Bucket Updates:** Everett Zufelt reported on the status of documentation for buckets one, two, four, and five, noting that they had reviewed and merged pull requests provided by the team ([00:04:08](#)). George Fitzgibbons confirmed that there was now full coverage across all identified buckets and proposed reviewing the current progress to ensure alignment on documentation and architecture diagrams ([00:05:13](#)).
- **Project Timeline and Planning:** The group discussed setting a timeline for the project, specifically regarding the hackathon scheduled for late September. They agreed to time-box the initial phase of development leading up to this event to ensure they remained on track with their goals ([00:10:01](#)).
- **Hackathon Outputs and Tooling:** The participants discussed what specific outputs the working groups should produce, such as architecture diagrams, use cases, and opinionated articles regarding tooling. Tim Benniks suggested including articles that articulate specific opinions on when CLI tools might be more effective than agents, which would serve to help the community identify relevant use cases ([00:11:04](#)).
- **WebMCP and Tooling Opinions:** The discussion shifted to WebMCP and its potential role in user-facing agents, with Danny Lake suggesting it would be a significant development for commerce and retail ([00:13:33](#)). Devon Hillard noted that while WebMCP is technically interesting, adoption in retail currently faces hurdles regarding brand control, suggesting that initial use cases might be better suited for the information space ([00:14:29](#)).
- **WebMCP Technical Considerations:** Everett Zufelt and Tim Benniks analyzed the technical implementation of WebMCP, noting that it acts as a protocol for publishing tools and operates as a client-side solution requiring DOM interaction ([00:16:20](#)). They discussed the necessity of using headless browsers to manage these interactions, with Tim Benniks expressing concern about the token costs associated with parsing complex DOM structures ([00:17:09](#)).
- **Hackathon Logistics and Structure:** The team envisioned the hackathon as an event for approximately 30 to 50 people lasting around six hours. They planned a two-part structure: an initial educational session focused on frameworks and buckets, followed by a free-form "build" session where participants could apply their knowledge within defined guardrails ([00:21:33](#)).
- **Pedagogical Strategy:** Danny Lake emphasized that the primary goal of the hackathon should be teaching participants how to identify new problems suitable for agentic solutions, rather than just coding ([00:22:28](#)). The group agreed that

the most valuable outcome would be changing how attendees think about development and agent workflows ([00:23:43](#)) ([00:26:33](#)).

- **Use Case Examples and Data:** To assist participants, the group planned to provide example use cases and datasets, such as CSV or SQLite files, for each bucket ([00:27:31](#)). Danny Lake proposed creating an interview-style "skill" that would guide participants through identifying their domain and selecting the appropriate bucket and workflow based on their specific needs ([00:28:16](#)).
- **Technical Prerequisites and Attendance:** The participants acknowledged the need to define clear prerequisites for attendees to avoid wasting time on local environment setup. Tim Benniks and Devon Hillard suggested that attendees should be prepared with a laptop, an LLM connection, and familiarity with Git, as the event is intended for those capable of building ([00:31:35](#)) ([00:34:28](#)).
- **Working Group Mandate and Persona:** Everett Zufelt and Devon Hillard reiterated that the working group's mandate is "Enterprise Agent Architecture" ([00:36:15](#)). They clarified that while they do not wish to be exclusionary, the hackathon is intended for people who want to "hack things" and build enterprise-grade systems with security and logging in mind ([00:37:15](#)).
- **Infrastructure and Environment Setup:** To reduce friction for participants, George Fitzgibbons suggested utilizing Vercel to provision managed infrastructure, such as AI gateways and sandboxes, so attendees can focus on building rather than configuration ([00:41:06](#)). The group discussed using these tools to allow participants to focus on high-level patterns, security, and enterprise integration ([00:43:13](#)).
- **Checklist and Onboarding:** Everett Zufelt proposed creating a pre-event checklist to ensure attendees arrive ready to contribute. The team aimed to create a "box" of resources and a clear set of tasks that participants can verify before the event, which would also serve as a standalone toolkit for others to run similar hackathons ([00:46:15](#)) ([00:49:46](#)).
- **Sponsor Coordination and Future Planning:** Rebecca Veldon agreed to consult with Holly to determine if there are sponsor requirements that might dictate specific technology choices for the hackathon ([00:50:42](#)). The team concluded by agreeing to build out the project backlog and move forward with the identified deliverables in the coming weeks ([00:54:11](#)).

# Agent Ecosystem Working Group 1: Enterprise Agent Architecture - MACH Alliance - Transcript

00:00:13

**Everett Zufelt:** Good

**Rebecca Veldon:** Hello. We should start getting people to trickle in surely.

**Danny Lake:** Hi team

**Rebecca Veldon:** blue. How you

**Danny Lake:** George,

**Rebecca Veldon:** been?

**George Fitzgibbons:** Hey

**Danny Lake:** how did uh how did the wedding go?

**George Fitzgibbons:** there.

**Danny Lake:** Rebecca,

**Rebecca Veldon:** It went lovely. Thank you.

**Danny Lake:** awesome. Welcome back.

**Rebecca Veldon:** Yes,

**Danny Lake:** I'm sure it was

**Rebecca Veldon:** it's very much hitting the ground going,

**Danny Lake:** nice.

**Rebecca Veldon:** but the wedding was beautiful. Thank you.

**Danny Lake:** Awesome. How was the Yeah.

**Rebecca Veldon:** Got a couple more weeks before the honeymoon.

**Danny Lake:** How was the weather?

**Rebecca Veldon:** Uh, it rained intermittently unfortunately.

**Danny Lake:** Oh, yeah. It's always like good luck, right, if it

**Rebecca Veldon:** It is.

**Danny Lake:** rains.

**Rebecca Veldon:** It is meant to.

**Everett Zufelt:** rain in England.

**Rebecca Veldon:** I know. Sure. it. We were hoping the weekend before was, uh, very warm, so we were hoping for good weather,

**Danny Lake:** Where are you going for your honeymoon?

**00:01:58**

**Rebecca Veldon:** uh, Italy.

**Danny Lake:** Oh, yeah. That sounds nice.

**Rebecca Veldon:** So, we're doing a bit of a tour through it. At some point, I need to book train tickets as well.

**Danny Lake:** That's why I'm so jealous about living in Europe is like I'm you have so much nearby and I mean I don't know if the flights are still really cheap but back when I was like backpacking it was like \$30 a

**Rebecca Veldon:** Yeah,

**Danny Lake:** flight.

**Rebecca Veldon:** it also helps cuz I have family over in the Czech Republic, so it it's quite in the middle, so I can just hot spot from there.

**Danny Lake:** Yeah, it's a little home

**Rebecca Veldon:** Yeah,

**Danny Lake:** base.

**Rebecca Veldon:** it's why I keep saying we need to do a Mac X in Prague. I'm I'm being outvoted,

**Danny Lake:** Okay,

**Rebecca Veldon:** but I'm just waving my

**Danny Lake:** pay

**Tim Benniks:** What's up?

**Rebecca Veldon:** flag.

**Danny Lake:** attent

**Tim Benniks:** I just saw a really fun tweet. I'm not sure how fun it is, but like um Mistrol updated their new model on hugging face and it's so big that their S3 um how do you call this?

**00:03:06**

**Tim Benniks:** How much money they pay is so high that they're almost bankrupt. Let me find it's red.

**Danny Lake:** Not big in parameter wise,

**Rebecca Veldon:** Wow.

**Danny Lake:** but big in size on

**Tim Benniks:** I think so.

**Danny Lake:** disk.

**Tim Benniks:** If it's S3, here you go.

**Danny Lake:** Yeah, it's getting kind of crazy,

**Tim Benniks:** Oh,

**Danny Lake:** isn't it?

**Tim Benniks:** wait. This is just the release. Wait, it was on LinkedIn. Oh, yeah. Here we go. Here. The CTO hugging face. It's funny. I I can It almost must be a joke, but it seems like 800 PB. What does that mean?

**Danny Lake:** What? Oh my goodness.

**Tim Benniks:** It's also called the fat cat in French.

**Rebecca Veldon:** I love the

**Tim Benniks:** Yes.

**Danny Lake:** How much RAM do you need to run

**Tim Benniks:** Fat they call

**Rebecca Veldon:** name.

**Tim Benniks:** it

**Danny Lake:** that?

**Everett Zufelt:** Well, I was going to ask like it feels like if that's just their training corpus that could make Right.

**00:04:08**

**Tim Benniks:** probably You wouldn't put it on a hugging face

**Everett Zufelt:** It makes sense if it's the training corpus. It would not work. Exactly.

**Tim Benniks:** though.

**Everett Zufelt:** So, it feels it feels like there's something missing in the story.

**Tim Benniks:** I'm just going to find it and

**Danny Lake:** Okay.

**Tim Benniks:** say

**Rebecca Veldon:** Right. I feel like we may get a few more trickle in, but I feel like if people are happy to, we can start.

**Everett Zufelt:** So, um, George and Tim, I don't know if you have an agenda for the day, per se. I know that a few things have been I know there was a few poll requests. I think I've gotten to them all now and uh reviewed, feedback, accepted, merged, and then Tim, thank you for reviewing the one that I sent over. Um,

**Tim Benniks:** I I just sent you another one because I had typos.

**Everett Zufelt:** oh well, there you go.

**Tim Benniks:** Sorry about that.

**Everett Zufelt:** almost all of them have been um but yeah so uh

**Tim Benniks:** My bad.

00:05:13

**Everett Zufelt:** Danielle myself and Tim have contributed just I maybe I won't call them articles per se but some like documents around uh kind of how we're thinking about buckets one two four and five think Tim you did one and two donella did four I put five in um so we're starting to build up some some perspective on those pieces

**Tim Benniks:** Yep.

**Everett Zufelt:** which is Uh and then I think uh you know really I again I don't know that those are things that we're going to necessarily publish as articles on the on the mock alliance website but there certainly in here is documentation and they can help to support the hackathon that we're working on. Um who if anybody I don't know I don't recall did somebody put up their hand I think George you'd created the the GitHub issue. Did somebody put up their hand for three?

**Tim Benniks:** Yeah, we have Doc and Ryan

**George Fitzgibbons:** Maybe that's to the point of agenda and things of that. Uh the start, maybe we could review just kind of where we're at with buckets.

00:06:25

**George Fitzgibbons:** I think we do have full coverage now. I signed myself up for the last bucket nobody took. And the only kind of general agenda is maybe to run through that and then just discuss outputs. And so I think we started teeing that up last week as far as we

**Everett Zufelt:** Okay.

**George Fitzgibbons:** or lack of a word divide and conquer but they don't all have to look the same as far as output but general output of architecture diagram write up and then tangible example but that format I think is one thing that I'd love to open the door up for discussion. So with

**Devon Hillard:** And and sorry real real quick, George. Um Tim submitted the number two one already.

**George Fitzgibbons:** that,

**Devon Hillard:** Um I volunteered to take it in Slack, but Tim beat me to the actual execution.

**Tim Benniks:** Oh, my bad.

**Devon Hillard:** So you're good at your work's good.

**Tim Benniks:** I'm sorry, dude.

**Devon Hillard:** Uh it's all I might add

**Tim Benniks:** Put something in that you like. Change it.

**00:07:26**

**Tim Benniks:** whatever you want. It's all good.

**Devon Hillard:** a non-outing example, but uh your work is great.

**Tim Benniks:** Yeah,

**Devon Hillard:** So yeah.

**George Fitzgibbons:** I can't

**Tim Benniks:** cuz I also added some use cases if that makes sense in another folder because I felt

**Devon Hillard:** Yeah,

**Tim Benniks:** like that's what I thought we discussed last time to also have so a few use cases.

**Devon Hillard:** Tim should get your credit so far. He he did the he delivered.

**George Fitzgibbons:** Oh,

**Devon Hillard:** Yeah,

**Tim Benniks:** Well,

**Devon Hillard:** I I Nothing wrong with

**Tim Benniks:** my my my clanker friend helped me deliver quite fast. That's why my PR just now was there.

**Devon Hillard:** that.

**Tim Benniks:** It's like it actually spoke to me in the result. Oh crap. Going to have to take that out. Anyways,

**George Fitzgibbons:** So with

**Everett Zufelt:** And and I got that I got that merged in for you,

**George Fitzgibbons:** that

**Tim Benniks:** oh thanks. So I'm still quite interested, George, in also looking at two by the way.

**00:08:16**

**Tim Benniks:** Does it look like the ticket did you update this?

**George Fitzgibbons:** we we this

**Tim Benniks:** because it looks like a different ticket than before because

**George Fitzgibbons:** is well let's find

**Tim Benniks:** we didn't have three filled out and I was filled in one and two.

**George Fitzgibbons:** the okay well let's get on the same page

**Tim Benniks:** So

**George Fitzgibbons:** there I this and everybody can watch me bumble through the screens.

**Tim Benniks:** let's

**George Fitzgibbons:** This is the one I was working out

**Devon Hillard:** Right. I think number two should be Tim because he actually just delivered

**George Fitzgibbons:** of.

**Devon Hillard:** that that there

**Tim Benniks:** have seen an older version or something. Anyways, it's it's done now.

**Devon Hillard:** was nothing.

**Tim Benniks:** It's fine.

**George Fitzgibbons:** Okay.

**Everett Zufelt:** But but but uh but like hey like I mean that there's the document Tim that you had shared but like just

**George Fitzgibbons:** Yeah,

**Everett Zufelt:** work working on this over the next few months.

**George Fitzgibbons:** there's two different conversations.

**Everett Zufelt:** There's lots and lots of other work that needs to be right but yeah.

**00:09:05**

**Tim Benniks:** Oh, there's lots to do. Yeah, it's all good.

**Everett Zufelt:** Yeah.

**George Fitzgibbons:** Yes.

**Tim Benniks:** Let's share.

**Everett Zufelt:** What's up?

**Tim Benniks:** Yeah. Yeah,

**Devon Hillard:** Yeah.

**George Fitzgibbons:** So to that point,

**Tim Benniks:** sure.

**George Fitzgibbons:** these are to ever put these are subgroups that will work in the next month or two. We'll have these regroup meetings, kind of go through what we gone through. But just to ensure we're on the same page, this list Devin is this can we call this the source of truth of we'll call them sub agents or uh sub you know subworking groups uh anybody want to be added changed or

**Tim Benniks:** I feel like we all will have some opinions on the different buckets once things materialize a

**George Fitzgibbons:** Yeah.

**Tim Benniks:** bit more.

**Everett Zufelt:** Yeah.

**Tim Benniks:** So maybe this is just for this first go round and then we'll see. Or is that maybe too loose?

**George Fitzgibbons:** Do we want to time box this in

**Tim Benniks:** Yeah.

**Everett Zufelt:** Cool.

**Tim Benniks:** Well,

**George Fitzgibbons:** phases?

**00:10:01**

**Tim Benniks:** how about we time boxes for like a month or something

**George Fitzgibbons:** Well, I have an even better idea or not a better idea,

**Tim Benniks:** about

**George Fitzgibbons:** but a different idea. Uh,

**Tim Benniks:** that.

**George Fitzgibbons:** weren't we just talking about uh that the conferences in September?

**Tim Benniks:** End of September. Yeah.

**George Fitzgibbons:** Do we want to time box the first and call this phase one of work before the conference or do we want to just do a month because we do two meetings a month so that isn't too much.

**Tim Benniks:** Time flies, man. Yeah, like maybe what we could like now that we are quite close,

**George Fitzgibbons:** Uh

**Tim Benniks:** we're just missing three for like the bigger descriptions and then we need some more of the use cases. Actually, maybe what we can do is discuss what we actually want at the end of September and then fill this out.

**George Fitzgibbons:** Okay. Time box TBD and then

**Tim Benniks:** There we go.

**George Fitzgibbons:** let's create a subage.

**Tim Benniks:** Oh, you're using it like Jira, man.

00:11:04

**Tim Benniks:** I like it.

**George Fitzgibbons:** Yeah, I'm just going right now.

**Tim Benniks:** Just kidding.

**George Fitzgibbons:** uh outputs and so to that point, how do we do this? in it documentation you and these aren't these are just placeholders use cases and uh open and so my prompt is I think this should be active discussion so what do you think so let's again say if we're time box this we got a sub agent working for two months or a What do we want? And I know we're all humans here, uh, but what do we want the subgroups to create or what should we create? Documentations, use cases, and maybe examples.

**Tim Benniks:** What about like more opinion stuff as well? Like I did I did an article the other day about that not everything has to be like a full agent when your CLI can do a lot of the work which is on purpose because it's in that one and two bucket. I did that on purpose but that like an article like that might be quite interesting to also then put on the Mac Alliance blog so people can maybe identify with the use case or something.

00:12:29

**George Fitzgibbons:** Okay, that

**Tim Benniks:** Maybe not everybody's a writer, so we don't have to.

**George Fitzgibbons:** is

**Tim Benniks:** But for me, it feels like I also learn about my own opinions about this stuff when I write like that.

**George Fitzgibbons:** that's makes a ton of sense. To me, that's a great idea.

**Tim Benniks:** Scope creep, but still

**George Fitzgibbons:** No,

**Tim Benniks:** interesting.

**George Fitzgibbons:** I think my general idea is we should just have like boilerplate. When we think of a subgroup, what are they creating? Oh, god darn

**Tim Benniks:** Yeah.

**George Fitzgibbons:** it.

**Tim Benniks:** Did you just lose it? I wouldn't. Oh, no. You lost it. Oh,

**George Fitzgibbons:** Oh.

**Tim Benniks:** there we go. Oh, GitHub. That is such a weird way of building a

**George Fitzgibbons:** This is working uh opinions,

**Tim Benniks:** website.

**George Fitzgibbons:** prescriptions. Oh, two there's one other things you said tooling because like I feel um this is random but maybe it's true but like CLI may be better than MCP in some of these use cases etc etc.

**00:13:33**

**Tim Benniks:** Exactly. And then we have the A2A stuff when we go up higher.

**George Fitzgibbons:** Okay.

**Tim Benniks:** You know, it's it's actually quite interesting. I'm sure Danny, you have some opinions there on what kind of stuff works.

**Danny Lake:** I was just looking at uh web MCP.

**Tim Benniks:** Oh, yeah. Me, too.

**Danny Lake:** I think it would be super cool if we're doing any storefront or like user facing obviously we want to do that because I really believe that's going to be coming really fast and it's going to blow people's

**Tim Benniks:** Yeah, I'm in the Google user group for that.

**Danny Lake:** minds.

**Tim Benniks:** Well, I'm more like subscribe, but they put me in through work. I can see if I can get some more information.

**Danny Lake:** Yeah, this would show really show us ahead of the curve.

**George Fitzgibbons:** Are you

**Tim Benniks:** Yeah. And that can fit in all buckets basically, right?

**George Fitzgibbons:** okay?

**Danny Lake:** Yeah, because you're going to go to a website and say, "Buy me the pants size whatever that your agents using the web MCP

**00:14:29**

**Tim Benniks:** Yeah. And the website just knows how to buy.

**Danny Lake:** implementation." It's Yeah,

**Tim Benniks:** Like it's very

**Danny Lake:** you're not going to be clicking around anymore.

**Tim Benniks:** interesting.

**Danny Lake:** So, your agent talking to the site and maybe the site has an agent as well, but I think that'd be really cool for tooling.

**Tim Benniks:** Yeah. We like and also that that's a cross bucket thing which is we might have to we might find that there's a few things across agents but have you guys seen that a website could have an agent your agent could talk to? Have we seen this in the

**Devon Hillard:** I think at least in the retail side,

**Tim Benniks:** wild?

**Devon Hillard:** we run into the same problems that we were having with a lot of the kind of UCP and and ACP stuff where a lot of lease retailers don't want to give up the brand presence control of the experience etc etc.

**Tim Benniks:** Yeah,

**Devon Hillard:** There's not enough consumer traffic using that yet to make it super attractive.

**Tim Benniks:** true.

**Devon Hillard:** Uh I think WebMCP is super super cool but I think the the V1 use cases are not in retail.

00:15:31

**Devon Hillard:** Uh they're in you know

**Tim Benniks:** It's more in the information space.

**Everett Zufelt:** It it's it's so funny.

**Tim Benniks:** Maybe

**Everett Zufelt:** Yeah. You know, because I don't think you're wrong. I I I have heard some similar things. I just as you were talking though, I kept saying to hearing in the back of my head, but what am I going to do with all these horseshoes? Like, we don't get to choose. Retailers don't.

**Tim Benniks:** No,

**Everett Zufelt:** We're not you're not going to get my agent's already smart enough to go grab off your website whatever I want it

**Tim Benniks:** kind of already works,

**Everett Zufelt:** to web so it's interesting right MCP just makes

**Tim Benniks:** but it's just slower.

**Everett Zufelt:** it like what more reliable more certain fewer tokens to get the job done but at the end of the day I can already do everything I want to

**Tim Benniks:** Yeah. And it's um Well, yeah. It's like the guy who built like Clawbot said, it's like your website is also an API.

00:16:20

**Tim Benniks:** It's just slower to parse, right? That's what this is too. And web MCP is probably something that standardizes at least,

**Everett Zufelt:** Exact.

**Tim Benniks:** which is kind of fits in our thing, right? We like that standardization a

**Everett Zufelt:** Exactly. What I think is

**Devon Hillard:** But what webc is the opposite of standardization as far as like UCP and ACP go where we have commerce specific

**Tim Benniks:** bit.

**Devon Hillard:** standardization right MCP is I can I can publish any set of tools to provide actions that are not covered by other

**Everett Zufelt:** Correct. It's it's well,

**Tim Benniks:** Yeah,

**Everett Zufelt:** let's call it it's a protocol, right?

**Devon Hillard:** standards.

**Everett Zufelt:** It's they've standardized the how you publish the tools,

**Tim Benniks:** it is.

**Everett Zufelt:** not I I agree. UCP is saying and here's what the schema looks like. Uh here's the semantics. What the other interesting thing about WebMCP is it is a ve it is a clientside solution right like if you're

**Tim Benniks:** is.

**Everett Zufelt:** not if you're not parsing the DOM and running the JavaScript like there's

**00:17:09**

**Tim Benniks:** Yes.

**Everett Zufelt:** no API like there's what we would traditionally think of as a server you point a thing at that says v1 slash whatever like this is just within the DOM there are tools exposed but you have to have like actually parsed the DOM to get that

**Tim Benniks:** That might be its only downfall because if people have crazy DOM structures,

**Everett Zufelt:** So

**Tim Benniks:** it's way too much tokens to even parse.

**George Fitzgibbons:** Oh

**Tim Benniks:** But

**George Fitzgibbons:** s\*\*\*.

**Everett Zufelt:** well well I think what you would I mean theoretically what you do in this scenario is like this is running in a

**Tim Benniks:** yeah.

**Everett Zufelt:** headless browser or it's either running in your actual desktop browser or mobile browser and your agents interacting with it that way or via some sort of platform API or it's running in a headless browser agents interacting with it that way via a platform API. So you're probably not needing to parse the whole DOM.

**Danny Lake:** Oh,

**Everett Zufelt:** It just needs to say, "Hey, is there an MCP thingy over there once something

**00:18:15**

**Tim Benniks:** Yeah, it might be just like Google, right? They see a title and a canonical,

**Everett Zufelt:** else?" Yeah.

**Tim Benniks:** that's how they start. So, it might be something like that. Anyways, that was a bit of a side quest, but Denny, thanks. Actually, that's a really good point. We have to put it in somewhere. Would people be interested to learn about the outputs of the agents as in because I've seen it recently more often like at work like 20 different people made like their own like second brain because then Claude would just write into their own wiki or something and it's all kind of different and it's all burning tokens because that PDF or that markdown might just be a one used thing and then thrown away. And would there be maybe people looking at us for also figuring out what the output of all these agents could be if there's an output? Like sometimes you just buy this thing and you just buy it.

**Everett Zufelt:** Well,

**Tim Benniks:** But

**Everett Zufelt:** when I think through some of the use cases that I saw in the documents that were

**00:19:25**

**Tim Benniks:** sometimes

**Everett Zufelt:** contributed, like the output is I think the output was pretty clearly defined in the use cases for the ones you shared. And so like again I mean is what we're trying to do here to to kind of put

**Tim Benniks:** Yes.

**Everett Zufelt:** together the backlogs that we're building toward those use cases and have things we can walk people through during the hackathon

**Tim Benniks:** Yeah, maybe it's just too wide of a range that I took there.

**Everett Zufelt:** and then I guess that's what I kind of want to bring us back to right I think as a group we set a goal like we want to prepare ourselves a to be able to do this hackathon on at mock X. But then I think forget who said it, maybe Tim, it was you. How could we then package this up into a box and say anybody can go run this hackathon? Like we've given you all the tools, the resources, the scripts, the the repos, anybody can actually go run this hackathon, which I thought was really cool.

**Tim Benniks:** Yeah,

00:20:26

**Everett Zufelt:** So So should we be building the backlog?

**Tim Benniks:** that is very important.

**Everett Zufelt:** Should we be building this be building a backlog that gets us to that box full of tools?

**Tim Benniks:** Yeah. Yeah, it's interesting. So, George, should we talk a little bit about what we just discussed about what we might think this hackathon should be? Because maybe based on that we can change what outputs or is that too

**George Fitzgibbons:** No, I think it I think it's coming together uh nicely from the perspective of yes hackathon

**Tim Benniks:** early.

**George Fitzgibbons:** bookend. We have our buckets. Now what do we want to put in the buckets? Those will be the tools that we use for the hackathon. So I guess yeah that makes sense.

**Tim Benniks:** Well,

**George Fitzgibbons:** So I guess talk let's talk through format and maybe focus

**Tim Benniks:** and

**George Fitzgibbons:** on the first half. You know how we said breaking it up into architecture and then let it rip or how I forget what the framing was

**Tim Benniks:** yeah,

**00:21:33**

**George Fitzgibbons:** but

**Tim Benniks:** to take a quick step back, guys, we were just talking about doing this hackathon at the Mac Alliance conference and we went back and forth like for who is this, how long is it, how many people, like there's so many variables here and in the end we kind of came up with It's probably going to be between 30 and 50 people, people who request to be there. And then it's going to be all day or maybe 6 hours or something. In the first part, we talk about our buckets and our use cases and how it works and what tools to use. And then in the second part, it's kind of like a free-for-all. You want to build something here, like we gave you the guard rails of these five buckets. Choose what you want and then build the coolest thing and then present it. So, it's it's a little bit more chill after. And what's kind of likely is in the beginning are the people that are like the more high thinkers, maybe the less builders and in the second part it's more like, oh, I cannot finally go and type something into a terminal and actually do something or whatever.

**00:22:28**

**Tim Benniks:** Like, and that can be a mix, but then you have something for both because there will be product owners at some shoe company that really want to know this stuff, but might not be super inclined to then also build it all. we can then still teach them all this stuff. And so that's kind of the setup. Does that like resonate with you guys?

**Danny Lake:** I think up to me when we if if like obviously you have learning the technical how these things work. But I think most people don't know what how how to think like what the new problems are to solve. I you know I I constantly think about that from the engineering side. What are the new problems to solve when developing? Because every all of the problems to be solving should be making my coding agent better, right? So what are the problems to solve for your company when you're speaking to the audience that would make your customer lives whatever your customer interacts with you easier or your or

**Tim Benniks:** or your colleagues perhaps.

**00:23:43**

**Danny Lake:** internally let's list those out come up with three of those

**Tim Benniks:** Yeah.

**Danny Lake:** things and now is it a workflow is it a one LLM call is Is it a multi- agent thing? Right. I think to me like that's the most valuable thing you could get out of that

**Tim Benniks:** And also it's a perfect opener. What if we had these three use cases and we just explain some problems and then we can fit that into whatever we're coming up with now. That might be really

**Doug Wessel:** Are you suggesting um people bring their own use cases or we have

**Tim Benniks:** interesting

**Doug Wessel:** example use cases for them to build

**Tim Benniks:** if they bring them.

**Doug Wessel:** out?

**Tim Benniks:** We better be fast on our feet to know how we would solve them. I think in this room we can probably do that. So maybe

**Danny Lake:** My concern

**Everett Zufelt:** I I think the

**Tim Benniks:** combination

**Doug Wessel:** But do we need do do we need to be the people that solve that or can we

00:24:34

**Everett Zufelt:** assumption

**Tim Benniks:** we can help others with a

**Doug Wessel:** leverage our definitions our definitions of the five should I should be able

**Tim Benniks:** framework.

**Doug Wessel:** as a business user product owner whoever to say here's my use case which bucket does it fit in which technologies as part of the hackathon are available give me a framework to get started and and go for it and come out with something tangible that I can bring back that's how I was

**Tim Benniks:** Yeah.

**Everett Zufelt:** So,

**Tim Benniks:** So,

**Doug Wessel:** imagining it But

**Tim Benniks:** I love that

**Everett Zufelt:** so, so when I think about how I think about how humans function a

**Tim Benniks:** dog.

**Everett Zufelt:** lot, I think we should show up with for people who I'm I'm great at a lot of things, but naming things wretched. You ask me to name something, I'll normally I just say no or I'll sit there forever and come up with a terrible name. Some people are good at some things and bad at. We're all good at some things and bad at others. I think there are people who will be very comforted by and here's a use case you can practice building.

00:25:35

**Tim Benniks:** Yeah, exactly.

**Everett Zufelt:** And there are people who we can say and you know now that we've shown you each of these five archetypes and what they're good for and how to choose.

If you want to run on and build your own, that's okay, too. So, I think it should be both, right? There's we're going to have use cases. If you're the sort of person who's like, "Oh my god, how could I possibly pick a use case?" And we're going to if somebody just goes, "Oh man, s\*\*\*. That that's exactly what I need to solve this problem." They can go off and build whatever they feel like building.

**Tim Benniks:** Yeah, everybody learns differently also. Some people need to read, some people need to listen. I do more of

**Doug Wessel:** Yeah, totally fair.

**Danny Lake:** I think I think to if your goal is for someone

**Doug Wessel:** Yeah, makes sense.

**Tim Benniks:** those.

**Danny Lake:** to present or obviously multiple people present at the end of the day, we really have to lock down the tools and libraries that like we tell people to build

**00:26:33**

**Tim Benniks:** That's another angle we have to do.

**Danny Lake:** because how many hours are going to be burnt just trying to get the thing to run, right? No one's going to be deploying this in their environment connecting to actual services.

**Tim Benniks:** Yes.

**Danny Lake:** Like I don't think that expectation maybe it's like oh well why don't you use an MCP server but there's all these complexities. So if you have some local only way it's like here's what your data could be you know maybe instead of using their data it's like what what is your company what do you do and here's a prompt to generate some fake customers and orders in your domain. Now let's pretend that came from your real site or your real back end here's the workflow now and here's the libraries that you can use in to building your workflow agent. So everyone's building with the same. There's no production connecting to any APIs, right? Because that's just going to burn time, right? The goal is to learn how to think. To me, it's like how do you how do I train people to think differently to re undo all their habits?

00:27:31

**Danny Lake:** What's the new problem to be solving? Right? That's the hardest thing. And to me, like that unlock of getting to someone to actually realize what problems can be solved now, that's when it's like someone's eyes light up and they're like, "Oh my god." And then they go sit and work for 20 hours with Claude or

**Tim Benniks:** That's exactly what we want

**Doug Wessel:** So to that to that point,

**Danny Lake:** whatever.

**Tim Benniks:** then.

**Doug Wessel:** should we have let's just make it up three use cases per bucket and see if somebody resonates

**Tim Benniks:** Yes.

**Doug Wessel:** with one and maybe push themselves to go one level higher than they felt comfortable with, you know,

**Everett Zufelt:** I like that.

**Doug Wessel:** initially choosing and then get in there and try

**Everett Zufelt:** I like that. Right. I think it I think it gives flex.

**George Fitzgibbons:** One extra thing maybe to add the use cases.

**Everett Zufelt:** Yeah.

**George Fitzgibbons:** There should be example data and so like in the use cases if you just have like a file

**Everett Zufelt:** Yes.

00:28:16

**Doug Wessel:** 100%.

**Tim Benniks:** You're right.

**Doug Wessel:** Yeah.

**George Fitzgibbons:** of here's commerce data that fits the use cases that you can

**Everett Zufelt:** Yeah, I like that. Here's a bunch of here here's here's a a CSV or an

**George Fitzgibbons:** use

**Everett Zufelt:** SQLite file that's got, you know, 20 crappy products in it and you're going to now use an LLM to enhance those product descriptions or whatever, right?

**Danny Lake:** Then we could have a skill that they run that helps guide them through building the part of in the bucket that they want to work in. Right? We can make this as gigantic as possible. Hey, let's do an interview skill. What what's your company?

**Tim Benniks:** Yeah.

**Danny Lake:** What domain are you in? What would you like to solve? Okay. It sounds like you want to go into bucket one and now let's start building with the bucket one use cases that we've prepared already. Here's your sample data. Right? That's the future way of working. So try to train people how to work in a new

00:29:04

**Doug Wessel:** That makes sense.

**Tim Benniks:** Yeah. Why not just do that? Yeah, that's cool.

**Devon Hillard:** Yeah, I think

**Doug Wessel:** And and I'm sure we're going to have multi multiple folks choosing similar same buckets and same

**Danny Lake:** way.

**Devon Hillard:** we're

**Doug Wessel:** use cases. I'm just wondering are we going to have like a presentation readout at at the end to show like off the work to everyone that they've done?

**Tim Benniks:** I would like to, but it depends on the scale, right,

**Doug Wessel:** Yeah. Yeah.

**Devon Hillard:** So, if I can jump in real quick,

**Tim Benniks:** Doug?

**Devon Hillard:** I think that that having some example use cases is great, but in my experience with with hackathons, people love to solve problems that matter to them, either personally or at their work. And so, I think we should say, hey, if you if you're struggling for ideas, we've got some ideas, but also feel free to solve actual problems that you care about and will have some relevance to you later on. Um, the example data thing is great, but also that's one of the things that, you know, Claude is super good at, right?

**00:29:52**

**Devon Hillard:** Like that's that's a sub agent. Uh, create me a bunch of bad product data in a CSV. Like, you know, we can create some of that, but we don't have to spend a lot of time focusing on

**Tim Benniks:** Maybe our output is that skill Danny was just discussing,

**Devon Hillard:** it.

**Tim Benniks:** but we make that a little bit more rich so it could create the data, George. Or maybe we like what you're saying there is makes sense because I would always come with my own problem on these. However, not everybody's the same like Everett was saying. So, we might have to give them, okay, we have three in or five, whatever in these different scenarios. So, if you don't have an issue to fix, just grab one of those and have fun, but we're pretty sure you have some corner of dirty data in your company somewhere you might want to do

**Devon Hillard:** Yeah.

**Tim Benniks:** something with. So, think about that and use our fake data and then just solve it. And then when you get home, you can solve it for real.

**00:30:39**

**Everett Zufelt:** I like that, right? Because then then we kind of again we can we can break this down into like are you trying to make data better? Are you trying to help pick

decisions? Are you trying to what? Like we can get I like the prompting, right? What sort of agent would you like to try building? And oh, great. It sounds like what you're what sounds like what you want to most learn is like how to clean and generate data, but also how to route requests to the right whatever. So, we recommend you do this scenario and here's the sample data. Right?

**Doug Wessel:** Yeah,

**Everett Zufelt:** I love that.

**Doug Wessel:** I I think and to that point like about the skill, sorry. I I think that it makes a lot of sense like you for instance, one of the like prompts as part of that skill is hey, do you want to use your own use case or do you want to do you want us to give you one? Right?

**00:31:35**

**Doug Wessel:** Baked into that skill,

**Tim Benniks:** Yeah,

**Doug Wessel:** you can have that ask user question concept,

**Tim Benniks:** sure.

**Doug Wessel:** right? where you can have a delineated list or you can write your own answer. And and if if we design the skill in a way, it'll really guide them to the actual uh place that they need to go ahead and get started. All based on our best practices and our writings that we put together leading into it and built into the skill inherently.

**Tim Benniks:** Um, all this sounds like one thing we should then there might be one prerequisite or maybe two. bring your laptop and have an LLM that you can talk to through either code or some interface that's on your machine because if people come in without anything and expect us to deliver something like that to them, I don't think we can, right? Like if you come in with chat GBT but you don't have codecs,

**Devon Hillard:** Yeah,

**Tim Benniks:** you might not get very far.

**Devon Hillard:** we we should have like a prerequisite, you know, guide with some helpful, hey, this is, you know, you need one of these three tools.

00:32:36

**Devon Hillard:** You need to install these libraries.

**Tim Benniks:** more stakes. Yeah,

**Devon Hillard:** Make sure you got Yeah.

**Tim Benniks:** exactly.

**Devon Hillard:** Whatever that is.

**Tim Benniks:** Yeah.

**Devon Hillard:** I think that's pretty easy. real

**Everett Zufelt:** And again I I I and again what I like about what what we're describing here is yes

**Tim Benniks:** Yeah.

**Everett Zufelt:** it'll be great for mock X and if somebody has a local user group they can bring it to it and if a company wants

**Devon Hillard:** quick.

**Tim Benniks:** Yeah,

**Everett Zufelt:** to go train 50 of their engineers they can do it and like we could like now it's like this

**Tim Benniks:** of course.

**Everett Zufelt:** toolbox that you an agentic toolbox for teaching people how to build agents because there's lots of places you can go and build an agent. You can go to Vzero. You can go to Lang Langmith Fleet. You can go to Crew AI. You can go all over the place, right? There's lots of places you can go to just like low code an agent.

00:33:20

**Everett Zufelt:** This is now really helping you learn, engage, pick patterns, map the patterns, build the architect. It's really getting deep.

**Doug Wessel:** And you know if we're publishing something we could be publishing this in parallel to your point

**Devon Hillard:** Yep.

**Doug Wessel:** ever where where hey take our skill bring it into your LM of choice and this is this is mock alliance approved uh approach to to go forward.

**Tim Benniks:** Yeah. Yeah. And we just make this skill like Danny what you were saying. It has to be installable throughout all these kind of different ways you do it. And it can just live in literally our enterprise agent architecture on GitHub. And then you just do npx skills add and then whatever the URL and then run or whatever you want to do. You can tell claw to install it because not everybody will go to the terminal.

**Danny Lake:** I see.

**Tim Benniks:** Or can we assume that they

**Danny Lake:** least amount of friction. I would say clone this repo,

**Tim Benniks:** will?

**Danny Lake:** run your boot up your coding agent in a terminal in that folder and run this skill.

00:34:28

**Danny Lake:** You're good to go.

**Tim Benniks:** Yeah, that assumes that everybody understands that.

**Danny Lake:** No other installing required,

**Tim Benniks:** I don't think everybody will.

**Danny Lake:** right?

**Tim Benniks:** There will be people in cloud desktop who want to do the same.

**Danny Lake:** I'm thinking developer audience.

**Tim Benniks:** Yeah. So, we're not super sure if there will be some techsavvy marketers like this is

**Danny Lake:** Yeah.

**Everett Zufelt:** Well,

**Tim Benniks:** something that's still

**Everett Zufelt:** if there I think one of the things we need to then do and we don't need to answer right now. Um,

**Tim Benniks:** open.

**Everett Zufelt:** labels aside, what are the prerequisites? If you can't use Git, is that a deal breaker? Right. Right.

**Devon Hillard:** Yes,

**Everett Zufelt:** If you don't know how to connect to Wi-Fi, you're probably not going to be

**Devon Hillard:** I I have spent way too many hours helping well-meaning marketers vibe code and

**Everett Zufelt:** successful.

**Devon Hillard:** supporting them through not understanding how Git works and not understanding deployment and not understanding anything.

**Tim Benniks:** Yeah. Doing a Yeah, you're

**00:35:13**

**Devon Hillard:** I'd rather not do that here.

**Everett Zufelt:** Right. And again, I'm not I'm not saying that Git should be a deal breaker.

**Tim Benniks:** right.

**Everett Zufelt:** I'm saying over the next couple of sessions like we don't need to decide this tomorrow but over the next couple of weeks we should probably say hey prerequisites are hey you come with a computer you can connect to the Wi-Fi you you know yes or no you've got git may maybe not right you can install tools on the command line maybe maybe not like I don't know what the right answers are but we probably need to be able to say here's five bullet points right and and if you can't do these

**Tim Benniks:** Yeah.

**Devon Hillard:** Yeah.

**Everett Zufelt:** these five things. This may not be uh the session for that you're going to get a lot of value out

**Devon Hillard:** And

**Everett Zufelt:** of.

**Doug Wessel:** I feel like this I feel like this infrastructure thing is is the is the hard part up front. Is there any managed services,

**Devon Hillard:** I

**Doug Wessel:** virtual desktops, all this kind of stuff that's available um that like you liter like we're provisioning them when they walk in the door with everything they need in a in a box?

**00:36:15**

**Devon Hillard:** so I I'll ask the question, right? And I feel like the work that I think we're doing with the working group and and a lot of the other kind of technical pieces that we're the mock alliance has been creating is working to create I think those are really targeted at actual I I think enterprisegrade production solutions that we want our clients and and folks to build. Um, and this is so we're not really focused on the markers doing vibe coding or using co-work. We're focused on people who are wanting to learn from us and then go out and build honest to God enterprise systems with, you know, audit logging and security and multimodel failback and, you know,

**Everett Zufelt:** that that that is a that is an accurate I think that is an accurate

**Devon Hillard:** golden test.

**Everett Zufelt:** read of what of what the audience and the mandate is for for the organization and and I don't want to say not marketers doing things.

**Tim Benniks:** Yeah, Dean, you just answered the question.

**Everett Zufelt:** Uh but I but I want to be but I think the core audience is people

**00:37:15**

**Tim Benniks:** We're done.

**Everett Zufelt:** accountable for enterprise

**Devon Hillard:** Yes.

**Tim Benniks:** And that will actually,

**Everett Zufelt:** systems

**Tim Benniks:** let's just keep it simple. That will be folks that know how to use Git. Let's be honest, right? I'm

**Everett Zufelt:** and I don't want to be excl I don't want to be exclusive right I don't want to

**Doug Wessel:** I

**Everett Zufelt:** exclude people but the who the mandate of this working group is enterprise agent architecture like that right there in the name right enterprise agent architecture is the mandate of the working

**Tim Benniks:** And in the first part of the day where we talk about our problem statements and the the the framework we're coming up with, you can be not the most technical person and still learn something there just to know what we think is the ecosystem. And then when we get for real, those folks will probably not join anyways. But let's focus it more on the tech persona. You're right. So, citizen developers, that's a fancy name,

**Doug Wessel:** Sorry,

**George Fitzgibbons:** That's what we call it.

00:38:22

**Doug Wessel:** not to play not to play the devil's advocate,

**Tim Benniks:** George.

**Doug Wessel:** but the enterprise architects I tend to work at at Fortune 500s, like they've they don't touch Git. They've never touched Git. Their people touch Git,

**Tim Benniks:** Oh, there's so many angles to this.

**Doug Wessel:** right?

**Tim Benniks:** Look at Deon's face.

**Doug Wessel:** Sorry, but like these I don't know. I I I don't know. I I I hear what you're saying,

**Everett Zufelt:** Well,

**Tim Benniks:** Are they share for users

**Everett Zufelt:** so I I I think Yeah,

**Doug Wessel:** but

**Tim Benniks:** maybe?

**Everett Zufelt:** I think I mean he this a hackathon is for people who hack things,

**Doug Wessel:** Okay.

**Tim Benniks:** Yes.

**Doug Wessel:** All right. That That's fine.

**Tim Benniks:** Yeah. Let's be honest.

**Doug Wessel:** If that's the persona we're going after,

**Everett Zufelt:** right?

**Tim Benniks:** Yeah.

**Everett Zufelt:** I I mean,

**Doug Wessel:** forget what I said.

**Everett Zufelt:** Right. I just because I agree with you about enterprise architects. Um uh but a hackathon is for people who are want to build a

**00:39:07**

**Tim Benniks:** So, are those web masters,

**Everett Zufelt:** thing.

**Tim Benniks:** Doug? No, just I'm just kidding. But you have people who like organize

**Everett Zufelt:** I I I I'm also going to I'm also going to say something that I say a lot.

**Tim Benniks:** infrastructure.

**Everett Zufelt:** Think we're over comp shocker room of engineers or over complicating something.

**Tim Benniks:** You're probably right.

**Everett Zufelt:** If what we've said is we want to do a hackathon around agent architecture, then we can probably pretty simply answer some of those questions we have just by using the like hackathon agent architecture should answer most of the questions we've got here.

**Tim Benniks:** Okay, so Danny was right all along. That was

**Doug Wessel:** So part of the so part of the um goal potentially is also like setting up

**Tim Benniks:** easy.

**Doug Wessel:** that architecture. So we shouldn't uh make it too easy, right? It should be they should be thinking about what they're doing as part of that process as

**Tim Benniks:** Of

**Doug Wessel:** well. meaning that that infrastructure stuff, what considerations do I need to make when deciding which tools um you know

00:40:01

**Tim Benniks:** course.

**Doug Wessel:** that kind of thing. So, so maybe it's a it's a feature, not a bug that it's uh part of the

**Danny Lake:** I mean,

**Doug Wessel:** process.

**Danny Lake:** are you saying that like baked into the the skill that helps them start scaffolding an idea?

**Doug Wessel:** Yeah. Yeah. Yeah.

**Danny Lake:** Yeah,

**Doug Wessel:** Yeah. essentially like do I use bedrock here or do I you know not you know agent

**Danny Lake:** I think the so

**Doug Wessel:** core or do I go with a specific you know harness I

**Danny Lake:** I think an interview skill at the start is perfect for that because it's like where are you

**Tim Benniks:** It will help a

**Danny Lake:** today? What do you deploy on? What's your core technologies?

**Tim Benniks:** lot.

**Danny Lake:** What languages do you use? How much are you willing to completely adopt like a full agent framework like like Langmith?

**Everett Zufelt:** Yeah, I like some of the I I mean,

**Danny Lake:** Um

**Everett Zufelt:** again, I like the idea. I I suspect we're over complicating what is probably not that complicated of a thing.

**00:41:06**

**Everett Zufelt:** Some people who know somewhere between very little and a moderate amount about agents want to come together and learn and get their hands dirty. Is like is that a fair way to think about who we think our target audience is?

**George Fitzgibbons:** Yes.

**Danny Lake:** Yeah.

**George Fitzgibbons:** I in my opinion yes and to take it a step further to go to the statement around Danny point uh this is open forum you say no or anything but versel if we're going we would give AI gateway credits funnels through

**Tim Benniks:** But you already do. It's five bucks,

**George Fitzgibbons:** us you get five bucks but I could give a

**Tim Benniks:** right? Maybe that means nothing. Yeah,

**George Fitzgibbons:** lot more and feel like we would

**Tim Benniks:** exactly.

**George Fitzgibbons:** we when we do these hackathons we could provision so everybody pushes to the same Versel instance and infrastructure give a ton of AI gateways so people don't have to set up LMS they just start making calls and it just

**Tim Benniks:** I like

**George Fitzgibbons:** happens we could provision sandboxes so to Doug's point of

**00:42:13**

**Tim Benniks:** that.

**George Fitzgibbons:** setting up a machine like that's what Versell is we're managed infrastructure we're managing infrastructure for building agents.

**Tim Benniks:** So you can sponsor them.

**George Fitzgibbons:** We do these hackathons like once a week.

**Doug Wessel:** I didn't want to volunteer you.

**George Fitzgibbons:** We we're a very ne and I don't and I'm trying to be cognizant of other companies involved in this stuff, but we are we do these couple once a week. And so like I don't want to steamroll it, but we could easily come in and say we're enterprisegrade infrastructure. We could spend the morning talking about all the details of that and in the afternoon just here you

**Tim Benniks:** We can come up with all these other ones,

**George Fitzgibbons:** go.

**Tim Benniks:** but in the end for this works.

**Danny Lake:** You on mute, Deon?

**Tim Benniks:** Devon, you're

**Devon Hillard:** Sorry, I was saying I I don't actually use Versella truckload myself,

**Tim Benniks:** muted.

**Devon Hillard:** but I think that's absolutely the best path for this hackathon. I think it makes a ton of sense like Yeah. So, you got my vote.

**00:43:13**

**Danny Lake:** I'm I'm not sure about deploying this. Um because I would to me it's like do we want to teach someone like we just said this is an enterprise group. Um, I want to teach people how to think about the the meta patterns of how to build the agent and and and ship the agent no matter what infrastructure it's being shipped on. Yes, we absolutely do need an API key to burn tokens to test the agent, right? That's not going to be our subscription. So, we absolutely need like a gateway key. That would be amazing. And then because to me, if I walk out of that day knowing how to deploy to one provider on on Versell, that's good. But I think knowing how to deploy is different than knowing what patterns to scale out your agent that's going to run in your enterprise. Like what's

the most important thing? It's security, right? And what how do you start teaching people about those security questions they need to start asking, right? How does your agent use a tool that runs something in your enterprise?

**00:44:19**

**Danny Lake:** Can you use an MCP server? Do these people know what an MCP server is? Do they know how to authenticate to an MCP server? Do they know that an MCP server could encapsulate multiple API services that each could have different access requirements? Like how to me that's the most valuable stuff to start learning from a security because you said enterprise Everett and it's like that's how they're not going to be able to deploy the agent if they haven't signed up gotten a buy in from their security, right?

**Devon Hillard:** Sorry. Are you saying they just run it locally and just demo through like HDMI

**Danny Lake:** So look, yes, run everything locally because we're trying to teach people what how to rethink what the new problem

**Devon Hillard:** or

**Danny Lake:** surface area is for their business and the the ways that they can use it an agent to solve those problems. To me, that's the most valuable, right? These people are coming in to learn, not necessarily shipping something. To me,

**Tim Benniks:** My worry is Danny that people might not have the right dependencies on their machines and then we lose two hours for some whatever node

**00:45:21**

**Everett Zufelt:** So this is where this is where I'd go back to rather than worrying we can just

**Tim Benniks:** dependency.

**Everett Zufelt:** declare up front you must come with XYZ.

**Tim Benniks:** Oh yeah. So we can go that detailed in that. Yeah. Then in that case I

**Everett Zufelt:** I think I think so. But I I like the ide like I like the idea and and again we don't have to solve it today.

**Tim Benniks:** Yeah.

**Everett Zufelt:** Um I like the idea of like here's your thing in a box, right? Because we've all had the experience clone the repo, just run this one command. Oh, you need to install Xcode command line tools. Oh, your Ruby version's out of date. Oh, I can't find Pearl. like and then you like just want to call crawl into the corner and die because if your computer tells you to go find or install or update one more thing you're going to scream. We don't want that to be the experience. So like I like the idea of a way a means of and like this is could be a backlog item right?

**00:46:15**

**Everett Zufelt:** What is the thing we need to tell people they have to What's your pre-checklist that you come able to run? Insert Danny saying we could make it an agent skill. Um, what's the pre-checklist that you come able to run so that we know you're good to go. You know, maybe it's as simple as sign up for this free Versell account. Maybe it's make sure you've got Docker Desktop or whatever installed, right? whatever it is like there should just like I think for George and Tim let's just create an item in the backlog for somebody to grab and define what's that thing like what's

**George Fitzgibbons:** Oh

**Everett Zufelt:** that thing that we're going to tell people you need to do these three things so that you get the most out of the

**George Fitzgibbons:** s\*\*\*.

**Tim Benniks:** But you know what's great about that, Everett?

**Everett Zufelt:** day

**Tim Benniks:** We actually segregate exactly who's going to be coming in here or not based on that list. You know what I mean? If if we go like you need to

00:47:07

**Everett Zufelt:** I yeah like if you can't if you can't install Docker or figure out or or if it's if you can't figure out how to go

**Tim Benniks:** have

**Everett Zufelt:** sign up for a free Versel account,

**Tim Benniks:** No, but that's a different user,

**Everett Zufelt:** maybe maybe you're in the wrong room,

**Tim Benniks:** right?

**Everett Zufelt:** you

**Tim Benniks:** Like you have to know how to set up a Python virtual environment is a different need than sign up with a Forcell account and it happens virtually. And so if we go with that first one, we change the audience completely and that's a choice and that's totally fine. So it really helps us define what type of people we want in the room. I don't know. I have I've done so many of these events where that kind of small stuff went wrong. That's why I'm saying it now. That where because I'm with Danny. I would love if people just have a thing that works because then we know we have the right audience, right? But there might be so much additional learning for people that are not exactly there but a tiny bit off that could then learn that and then have a huge jump.

00:48:07

**Tim Benniks:** And if we can just say log into versell get this you know gateway account and have the s\*\*\* kind of just works and then we will teach you why it works. That's another angle of course that might also I don't know we are like the 0.1 percenters here right we know it all

**Danny Lake:** We could look about using remote coding workspaces could be run that on a versell sandbox

**Tim Benniks:** yeah cursor has that right oh

**George Fitzgibbons:** like like harnesses like an open agent harness.

**Danny Lake:** storage

**Tim Benniks:** yeah do you have like like master has workspaces they have something like

**Danny Lake:** right so nothing's actually running on the developer machine because then that completely removes the oh I don't have node installed you know I don't

**Devon Hillard:** But then am I am I logging in my cloud code account on some third party

**Tim Benniks:** No,

**Devon Hillard:** machine?

**Tim Benniks:** we just give the for sale tokens.

**Devon Hillard:** Okay.

**Tim Benniks:** George, you're going to burn some money,

**George Fitzgibbons:** Okay.

**Devon Hillard:** Yeah,

**Tim Benniks:** man.

**Devon Hillard:** I was going to say

**00:49:05**

**Danny Lake:** a local coding agent can point at a remote workspace

**George Fitzgibbons:** Yeah.

**Tim Benniks:** Yeah, true. Yeah, there's so many options here.

**Devon Hillard:** Yeah,

**Danny Lake:** environment.

**George Fitzgibbons:** Yes,

**Devon Hillard:** if you have that all set up, right?

**George Fitzgibbons:** we do. Yeah, there there's aspects, but I

**Devon Hillard:** Yep.

**George Fitzgibbons:** think

**Tim Benniks:** Oh, this. Yeah, I saw this

**Danny Lake:** But or or it's to say if you want to come to the session,

**Tim Benniks:** before.

**Danny Lake:** clone this repo and run this skill and it'll help get everything set up. And if you haven't done that,

**Tim Benniks:** You're actually Danny,

**George Fitzgibbons:** yes,

**Danny Lake:** what are you doing in this

**George Fitzgibbons:** I think

**Danny Lake:** session?

**Tim Benniks:** we might be making it that simple. If we just run a scale that asks you,

**George Fitzgibbons:** That's what I

**Tim Benniks:** hey, do you have this? No, maybe install it. If you don't know how to, maybe this is not your

**George Fitzgibbons:** think.

**Tim Benniks:** session.

**Everett Zufelt:** Yeah,

**00:49:46**

**Danny Lake:** If you can't walk through a skill that

**Everett Zufelt:** I I I I again going to keep saying this

**Danny Lake:** Yeah,

**Everett Zufelt:** over over guys,

**Tim Benniks:** Simplify.

**Everett Zufelt:** we're over complicating.

**Tim Benniks:** I'm just bald from these problems,

**Everett Zufelt:** We need we we just we I know but we need a backlog

**Tim Benniks:** you know.

**Danny Lake:** we just left engineer

**Tim Benniks:** Yes,

**Danny Lake:** stuff.

**Everett Zufelt:** item and then it can become a person's job to solve for this,

**Tim Benniks:** me too.

**Everett Zufelt:** right?

**Danny Lake:** Yeah.

**Everett Zufelt:** and in part and I don't know if this is true and maybe Rebecca this could be something uh maybe to find out from Holly for the group if it's possible before our next session. Um I is Mock Alliance going to want to find sponsors for the hackathon probably if for no other reason than to cover the cost of running it. and might that sponsor ringing come with it some criteria around using some of that vendor's technology because I think that even if we don't know who the sponsor is I think knowing the answer to that question like you know if

**00:50:42**

**Rebecca Veldon:** Yeah.

**Everett Zufelt:** whoever the sponsor is then you know obviously that might change the answer to the what do you need to have set up when you walk in the room so I think that would be helpful

**Rebecca Veldon:** Yeah, I'll speak to her tomorrow about it and hopefully we'll have a some way to go from it.

**Danny Lake:** So I feel like we need this asset figured out that will bootstrap the ability to do any of the five buckets.

**Tim Benniks:** Yeah, that's a good to-do and we can put that on our GitHub repository and we can all run it and see how that feels and shape it a bit.

**Danny Lake:** And I feel like settling on an LLM key to use using the using Burcell

**Tim Benniks:** Well, if they are the sponsor then in that case,

**Danny Lake:** Gateway.

**Tim Benniks:** right? Or is that separate? Everett, sorry to interrupt,

**Danny Lake:** No worries.

**Tim Benniks:** Denny.

**Danny Lake:** Which that's just something we need to figure out. We people need tokens because it's not going to be their coding agent that runs the agent.

00:51:56

**Danny Lake:** That's like something they need to understand as well. Your sub doesn't run your agent for

**Tim Benniks:** Exactly. Exactly.

**Danny Lake:** you.

**Tim Benniks:** There are so many learning angles in this that is new that are so normal to us. We have to walk it back and really explain the basics and we might be pleasantly

**Danny Lake:** I think it's like I could easily burn hours talking

**Tim Benniks:** surprised.

**Danny Lake:** about every single aspect you should be thinking about when building an agent. But then I'm not teaching what the the retraining of a person's brain would be is my first goal. Otherwise, I'm just overwhelming them with them with stuff that they don't know why it matters.

**Everett Zufelt:** And and I I think you're I think you're right about that,

**Tim Benniks:** I

**Everett Zufelt:** Danny. I I also think there's a there's only like that in part,

**Tim Benniks:** agree.

**Everett Zufelt:** at least for me, that was a drip drip drip, not a dump dump dump. So like there's only so much retraining of a person's brain.

00:52:51

**Everett Zufelt:** We we can we can hopefully give people an aha moment but like in in a in a one-day hackathon we can give them some aha moments some hands-on experience some oh I never thought about it that ways the retraining of the brain takes months and months.

**Tim Benniks:** If we can get the light twinkle in their eyes because they finally found something that they didn't know

**Everett Zufelt:** Yes.

**Tim Benniks:** existed, that's all we need.

**Everett Zufelt:** If they go back to work and say oh my god everybody let me show you this thing.

**Tim Benniks:** That's all we need.

**Everett Zufelt:** That's the wiz.

**Tim Benniks:** It's the thing we constantly have even now,

**Danny Lake:** Yes.

**Devon Hillard:** It's

**Tim Benniks:** right? If they can have a bit of that vibe and imagine if they have that vibe and they present it to the group and we give them a beer and they start talking about it, then we are successful. It's going to be crazy the day after we do this or two days after I have to do this for content stack people and all our because we have an event right after in this a very similar venue but then it's all with like agent OS and on platform very different than code first so I'm excited to see how different people are going to be and also how maybe not so much sense it makes to have an onplatform agent builder

**00:54:11**

**Tim Benniks:** thing. We're going to learn.

**Everett Zufelt:** Awesome. Um,

**Tim Benniks:** I think we're

**Everett Zufelt:** maybe for the next for our next meeting, and I'm happy to roll up my sleeves and help with it.

**Tim Benniks:** good.

**Everett Zufelt:** Um, George and Tim, do you maybe want to like do some more building out now? Now that you've got like your your your I think we've got like a good shared understanding of the group of what we want to build. Do you want to take some time and build out a backlog for that? Like build out more of the tickets in the backlog.

**Tim Benniks:** Okay, it feels we can do it now, right George?

**Everett Zufelt:** Yeah.

**Tim Benniks:** Based on all

**George Fitzgibbons:** Yeah,

**Everett Zufelt:** And and again,

**George Fitzgibbons:** ball's

**Everett Zufelt:** I'm happy to join in on that and support if you'd like me to or or do it on your own.

**Tim Benniks:** this.

**George Fitzgibbons:** rolling.

**Everett Zufelt:** But um I think cuz then people can just start pulling tickets, right? And and contributing.

**Tim Benniks:** Sure.

**Everett Zufelt:** Maybe I'll create uh I think maybe just under that deliverables folder in the GitHub, we just do a hackathon like deliverable hackathon and then we can just start putting things into that if it makes sense.

**George Fitzgibbons:** What's

**Everett Zufelt:** Awesome.

**Tim Benniks:** Let's do

**Everett Zufelt:** Well,

**Tim Benniks:** it.

**Everett Zufelt:** great everybody. Really appreciate everybody's time today.

**Devon Hillard:** Sweet. Thank you guys.

**Tim Benniks:** All right. Cheers everyone.

**George Fitzgibbons:** up?

**Danny Lake:** Okay,

**Tim Benniks:** Have a good one.

**Danny Lake:** guys. Cheers.

**Rebecca Veldon:** Bye.
